INTRODUCTION

The 2015-16 National Family Health Survey (NFHS-4), the fourth in the NFHS series, provides information on population, health, and nutrition for India and each state and union territory. For the first time, NFHS-4 provides district-level estimates for many important indicators. All four NFHS surveys have been conducted under the stewardship of the Ministry of Health and Family Welfare (MoHFW), Government of India. MoHFW designated the International Institute for Population Sciences (IIPS), Mumbai, as the nodal agency for the surveys. Funding for NFHS-4 was provided by the United States Agency for International Development (USAID), the United Kingdom Department for International Development (DFID), the Bill and Melinda Gates Foundation (BMGF), UNICEF, UNFPA, the MacArthur Foundation, and the Government of India. Technical assistance for NFHS-4 was provided by ICF, Maryland, USA. Assistance for the HIV component of the survey was provided by the National AIDS Control Organization (NACO) and the National AIDS Research Institute (NARI), Pune.

Four survey questionnaires—household, woman's, man's, and biomarker—were used to collect information in 19 languages using Computer Assisted Personal Interviewing (CAPI). All women age 15-49 and men age 15-54 in the selected sample households were eligible for interviewing. In the household questionnaire, basic information was collected on all usual members of the household and visitors who stayed in the household the previous night, as well as socioeconomic characteristics of the household, water and sanitation, health insurance, and number of deaths in the household in the three years preceding the survey. Two versions of the woman's questionnaire were used in NFHS-4. The first version (district module), which collected information on women's characteristics, marriage, fertility, contraception, reproductive health, children's immunizations, and treatment of childhood illnesses, was fielded in the entire sample of NFHS-4 households. Information on these topics is available at the district, state, and national levels. In the second version of the questionnaire (state module), four additional topics, namely, sexual behaviour, HIV/AIDS, husband's background and women's work, and domestic violence, were also included. This version was fielded in a subsample of NFHS-4 households designed to provide information only at the state and national levels. The man's questionnaire covered the man's characteristics, marriage, number of children, contraception, fertility preferences, nutrition, sexual behaviour, attitudes towards gender roles, HIV/AIDS, and lifestyle. The biomarker questionnaire covered measurements of height, weight, and haemoglobin levels for children; height, weight, haemoglobin, blood pressure, and random blood glucose for women age 15-49 years and men age 15-54 years, and the collection of finger-stick blood for HIV testing in a laboratory. Questionnaire information and biomarkers were collected only with informed consent from the respondents.

The NFHS-4 sample was designed to provide estimates of all key indicators at the national and state levels, as well as estimates for most key indicators at the district level (for all 640 districts in India, as of the 2011 Census). The total sample size of approximately 572,000 households for India was based on the size needed to produce reliable indicator estimates for each district and for urban and rural areas in districts in which the urban population accounted for 30-70 percent of the total district population. The rural sample was selected

through a two-stage sample design with villages as the Primary Sampling Units (PSUs) at the first stage (selected with probability proportional to size), followed by a random selection of 22 households in each PSU at the second stage. In urban areas, there was also a two-stage sample design with Census Enumeration Blocks (CEB) selected at the first stage and a random selection of 22 households in each CEB at the second stage. At the second stage in both urban and rural areas, households were selected after conducting a complete mapping and household listing operation in the selected first-stage units.

The figures of NFHS-4 and earlier rounds may not be strictly comparable due to differences in sample size, and NFHS-4 will be a benchmark for future surveys. NFHS-4 fieldwork for Nagaland was conducted in all 11 districts of the state from 1 March to 3 October, 2016 by the Research & Development Initiative (RDI) and collected information from 11,213 households, 10,790 women age 15-49 (including 1,670 women interviewed in PSUs in the state module), and 1,596 men age 15-54. Survey response rates were 98 percent for households, 96 percent for women, and 92 percent for men.

This report presents the key findings of the NFHS-4 survey in Nagaland, followed by detailed tables and an appendix on sampling errors. At the time of finalization of this report, wealth quintiles for the country as a whole were not ready. Therefore, on finalization of the national report, the breakup of key indicators by wealth quintiles for all states will be provided as an additional document and uploaded on the official website of MoHFW and IIPS.

HOUSEHOLD CHARACTERISTICS

Household composition

More than 1 in 3 (35%) of Nagaland's households are in urban areas. On average, households in Nagaland are comprised of 4 members. Sixteen percent of households are headed by women, with 12 percent of the population living in female-headed households.

The vast majority of households in Nagaland have household heads who are Christian (89%). Seven percent of households have household heads who are Hindu and 3 percent of households have Muslim household heads.

Eighty-nine percent of households in Nagaland have household heads who belong to a scheduled tribe, 5 percent belong to a scheduled caste, and a very small proportion (0.8%) belong to an other backward class (OBC). Four percent of Nagaland's household heads do not belong to scheduled castes, scheduled tribes, or other backward classes.

Slightly less than one-third (32%) of Nagaland's population is under age 15; only 6 percent is age 65 and over. The overall sex ratio of the population is 968 females per 1,000 males, and the sex ratio of the population under seven years of age is lower (955 females per 1,000 males). Sixty-five percent of persons have an *Aadhaar* card.

Among children below 18 years of age, 7 percent have experienced the death of one or both parents. In all, 78 percent of children below 18 years of age live with both parents, 11 percent live with one parent (mostly with their mother), and the remaining 11 percent live with neither parent. Birth of sixty-eight percent of children under five years of age were registered with civil authorities, but only 48 percent of children have a birth certificate.

Housing characteristics

Twenty-eight percent of households in Nagaland live in a *pucca* house and almost all households (97%) have electricity. Only 2 percent of households do not use a sanitation facility, which means that household members practice open defecation, a substantial improvement from 14 percent at the time of NFHS-3. Open defecation is more common among rural households (2%) than urban households (0.3%).

Only one-third of households in Nagaland have water piped into their dwelling, yard, or plot.

Eighty-one percent of households use an improved source of drinking water, but only one-third have water piped into their dwelling, yard, or plot (34% in rural areas and 32% in urban areas). Ninety-six percent of households treat their drinking water to make it potable (mostly by boiling the water). One-third of households use a clean fuel for cooking.

Selected household possessions

Almost all urban households (98%) and 89 percent of rural households in Nagaland have a mobile phone. Seventy percent of households have a bank or post office account. BPL cards are held by 26 percent of households, up from 4 percent in NFHS-3. Agricultural land is owned by 62 percent of rural households and 17 percent of urban households. Overall, 46 percent of all households in Nagaland own agricultural land.

EDUCATION

School attendance among children

Eighty-nine percent of children age 6-17 years in Nagaland attend school (93% in urban areas and 87% in rural areas). School attendance is almost universal at age 6-14 years (94%) and then drops to 80 percent at ages 15-17. There is no gender disparity in school attendance in the 6-14 year age group; however, in the age group 15-17 years, 81 percent of girls compared with 78 percent of boys are attending school.

Are there gender differentials in children's school attendance?

Percentage of children attending school by age

Literacy, educational attainment, and media exposure

In NFHS-4, literate persons are those who have either completed at least standard six or passed a simple literacy test conducted as part of the survey. According to this measure, 81 percent of women and 86 percent of men age 15-49 are literate.

Only 19 percent of women age 15-49 in Nagaland have completed 12 or more years of schooling, compared with 22 percent of men.

Fifteen percent of women and 11 percent of men age 15-49 have never been to school. Only 19 percent of women age 15-49 in Nagaland have completed 12 or more years of schooling, compared with 22 percent of men.

Media exposure is lower among women than men in Nagaland. Sixty-two percent of women and 69 percent of men watch television at least once a week. Men (38%) are much more likely than women (28%) to read a newspaper or magazine at least once a week. Slightly more than one-third (34%) of women and one-fourth (26%) of men are not regularly exposed to print media or other forms of media.

FERTILITY

Age at first marriage

The median age at first marriage is 22.3 years among women age 25-49 years and about 27 years among men age 30-49 years. On average, men get married five years later than women. Thirteen percent of women age 20-24 years got married before the legal minimum age of 18, down from 21 percent in NFHS-3. Eight percent of men age 25-29 years got married before the legal minimum age of 21, down from 18 percent in NFHS-3.

Fertility levels

The total fertility rate (TFR) in Nagaland is 2.7 children per woman, implying that the state has 0.6 children more than the replacement level fertility. Fertility increased by 0.5 children in the 13 years between NFHS-1 and NFHS-3, and declined by one child in the 10 years between NFHS-3 and NFHS-4.

Fertility Trends

Total fertility rate
(children per woman)

Fertility in urban areas, at 1.8 children per woman, is well below replacement level, but fertility is almost twice as high in rural areas (3.4 children per woman). Among births in the three years preceding the survey, 26 percent were of birth order four or higher, compared with 40 percent in NFHS-3.

The greatest differentials in fertility are by religion and schooling. At current fertility rates, women with no schooling will have 2.6 children more than women with 12 or more years of schooling (a TFR of 4.4, compared with 1.8). Similarly, Muslim women will have an average of 2.3 children more than Hindu women (a TFR of 4.0, compared with 1.7).

How does fertility vary with schooling?

Total fertility rate (children per woman)

Pregnancy outcome

Ninety-four percent of last pregnancies in the five years preceding the survey ended in a live birth, and the remaining 6 percent terminated in foetal wastage (abortion, miscarriage, or stillbirth). Miscarriages are the most commonly reported type of foetal wastage, accounting for 4 percent of all pregnancies, and abortions accounted for 2 percent. A majority of abortions were performed in the private health sector (55%) and 14 percent were performed in the public health sector. Eighteen percent of women reporting an abortion reported having complications from the abortion.

Teenage pregnancy

Among young women age 15-19 in Nagaland, 6 percent have already begun childbearing, that is, they have already had a live birth or are pregnant with their first child, down from 8 percent in NFHS-3. Almost no women age 15 years and 2 percent of women age 16 years have started childbearing, but this proportion increases sharply to 8 percent among women age 18 years and 15 percent among women age 19 years. Young women who had no schooling are much more likely to have begun childbearing than young women with 12 or more years of schooling (12%, compared with 1%).

Birth intervals

The median interval between births in the five years before the survey in Nagaland is 30.2 months, almost two months longer than in NFHS-3. Eleven percent of births take place within 18 months of the last birth and 30 percent occur within 24 months. Slightly less than two-thirds (64%) of births occur within three years of the previous birth.

Sixty-four percent of births in Nagaland occur within three years of the previous birth.

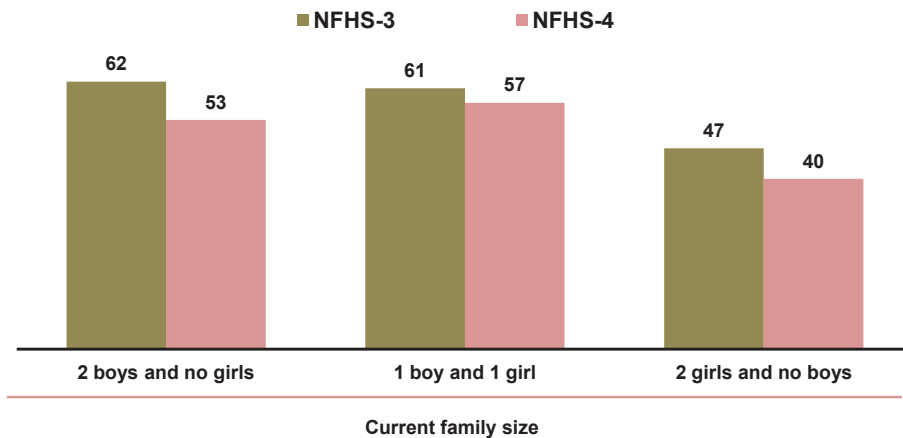

Fertility preferences

Fifty-two percent of currently married women and 55 percent of currently married men want no more children, are already sterilized, or have a spouse who is sterilized. Among those who want another child, 27 percent of women and 29 percent of men would like to wait at least two years before the next birth. Thirty-six percent of women and one-third of men consider the ideal family size to be two or fewer children.

In Nagaland there is a preference for sons. Twenty percent of women and 31 percent of men want more sons than daughters, but only 10 percent of women and 9 percent of men want more daughters than sons. However, about 9 in 10 men and women would like to have at least one son and at least one daughter.

How does son preference affect women's desire for children?

Percentage of currently married women with two children who want no more children

Women's desire for more children is affected by their current number of sons. For example, among women with two children, 53 percent with two sons and 57 percent with one son want no more children, compared with 40 percent with two daughters who want no more children. Notably, however, the proportion of currently married women with two children who want no more children irrespective of their number of sons has decreased by only 5 percentage points in the 10 years since NFHS-3.

In Nagaland, unplanned pregnancies are relatively common. If all women were to have only the number of children they wanted, the total fertility rate would drop by 0.4 children.

FAMILY PLANNING

Contraceptive knowledge and use

Knowledge of contraception among currently married women is almost universal in Nagaland. However, some methods are still less well known. Only 54 percent of currently married women know about injectables, 30 percent know about male sterilization, and 17 percent know about female condoms. Among all women, more than one-third (35%) know about emergency contraception.

The contraceptive prevalence rate (CPR) among currently married women age 15-49 is 27 percent, down from 30 percent in NFHS-3. Modern method use is 21 percent, almost the same as in NFHS-3. Notably, the share of female sterilization in contraceptive method use has remained unchanged, at 33-34 percent, in the two most recent NFHS surveys. Contraceptive use in NFHS-4 increases sharply with age from 3 percent for women age 15-19 to 29-33 percent for women age 30-49.

How many women use family planning?

Percentage of currently married women

In Nagaland, contraceptive use is higher in urban areas (31%) than in rural areas (24%). Contraceptive prevalence increases somewhat with increasing schooling. Muslim women (24%) are less likely to use contraception than Christian (26%) or Hindu women (35%).

Women in Nagaland are more likely to use contraception if they already have a son. For example, among women with two children, 33 percent with at least one son use a method of family planning, compared with 25 percent of women with two daughters and no sons.

The most common modern spacing methods used by currently married women in Nagaland are the IUD or PPIUD (7%) and the pill (4%). In general, urban women and older women (25 years and above) are more likely than other women to use spacing methods.

What contraceptive methods do women use?

Currently married women

Seventy-four percent of sterilized women had their sterilization operation in the public sector, mainly in a government or municipal hospital, and 80 percent of IUD or PPIUD users had their IUD or PPIUD insertion in the public sector.

The majority of pill and condom/*Nirodh* users get their supply from the private sector. Only 12 percent of pill users and 13 percent of condom/*Nirodh* users get their supply from the public sector.

The 12-month discontinuation rate for all methods is 33 percent. Thirty-nine percent of users of modern spacing methods discontinued use within the first year after they adopted the method. The most common reasons for discontinuation are the desire to become pregnant and side effects or health concerns.

Contraceptive Prevalence Rate by District

Percentage of currently married women

The contraceptive prevalence rate among currently married women age 15-49 is 27 percent, and the share of female sterilization among contraceptive method users is 34 percent.

Informed choice

Women who know about all available contraceptive methods and their side effects can make better choices about what method to use. Only 30 percent of users of selected modern contraceptive methods were ever told by a health or family planning worker about other methods they could use. Only 32 percent were told about the possible side effects or problems with their method, and even fewer (18%) were told what to do if they experienced any side effects.

Only 30 percent of users of selected modern contraceptive methods were told by a health or family planning worker about other methods they could use.

Men's attitudes

Twenty-one percent of men age 15-49 in Nagaland agree that contraception is women's business and a man should not have to worry about it. However, only 28 percent of men think that women using contraception may become promiscuous. Slightly less than two-thirds (64%) of men know that a condom, if used correctly, protects against pregnancy most of the time.

Unmet need

Unmet need for family planning is defined as the percentage of currently married women who either want to space their next birth or stop childbearing entirely, but are not using contraception. According to this definition, 22 percent of currently married women have an unmet need for family planning, down from 28 percent in NFHS-3. Currently, 55 percent of the demand for family planning is being satisfied and 44 percent of the demand is being satisfied by modern methods. The percentage of demand for family planning that is satisfied has increased since NFHS-3 (51%).

INFANT AND CHILD MORTALITY

The infant mortality rate in Nagaland in NFHS-4 is estimated at 30 deaths before the age of one year per 1,000 live births, down from 38 in NFHS-3. Under-5 mortality has also come down substantially to 37 from 65 per 1,000 live births since NFHS-3. As expected, boys have a slightly higher mortality rate than girls during the neonatal period (in the first month of life), and also between ages 1 and 5 years. During the postneonatal period (ages 1-11 months) girls have a higher mortality rate.

All early childhood mortality rates are higher for children in rural areas than in urban areas.

Trends in Infant Mortality

Deaths per 1,000 live births

Children born to mothers under age 20 and age 30-39 are more likely to die during infancy than children born to mothers in the prime childbearing age (20-29 years). Infant mortality is 30 per 1,000 live births for mothers age 30-39, compared with 26 per 1,000 live births for mothers age 20-29. Having children too close together is especially risky. Usually, children born less than two years after a previous birth are more likely to die in infancy than children whose mothers waited four or more years between births. However, in Nagaland there is not much difference in infant mortality rates by the previous birth interval.

High-risk births have higher mortality rates

Deaths in the first year of life per 1,000 live births

All early childhood mortality rates are higher in rural areas than in urban areas. The infant mortality rate is higher for children whose mothers have no schooling (33 per 1,000 live births) or less than 10 years of schooling (30 per 1,000 live births) than for children whose mothers have completed 10 or more years of schooling (25 per 1,000 live births).

Note: Category "Mother's age at birth 40-49" is not shown since there are fewer than 250 unweighted person-years of exposure to the risk of death

MATERNAL HEALTH

Antenatal care

Among mothers who gave birth in the five years preceding the survey, 44 percent received antenatal care (ANC) for their last birth from a skilled provider (36% from a doctor and 8% from an auxiliary nurse midwife (ANM), lady health visitor (LHV), nurse, or midwife). Fifty-four percent did not receive any antenatal care. Among mothers who gave birth in the five years preceding the survey, 42 percent registered the pregnancy for the most recent live birth. Among the registered pregnancies, 74 percent received a Mother and Child Protection Card (MCP Card).

One-quarter of women received antenatal care during the first trimester of pregnancy, as is recommended. Only 15 percent of mothers had four or more antenatal care visits; urban women (29%) were much more likely than rural women (9%) to receive four or more antenatal visits. The proportion of women who received four or more antenatal care visits for their last birth increased from 12 percent in NFHS-3 to 15 percent in NFHS-4, but the percentage receiving an antenatal check in the first trimester decreased from 29 percent to 25 percent in the same period. For 42 percent of their last births, mothers received iron and folic acid (IFA) supplements, but only 4 percent consumed them for the recommended 100 days or more. Sixty-four percent of last births were protected against neonatal tetanus through tetanus toxoid vaccinations given to the mother. Only 2 percent of mothers took an intestinal parasite drug during pregnancy.

Four or More Antenatal Care Visits by District
Percentage of last births in the past five years

Only 15 percent of mothers in Nagaland had at least four antenatal care visits for their last birth.

Among women with a live birth in the five years preceding the survey who met with a community health worker in the last three months of pregnancy for their most recent live birth, 37- 57 percent received advice on each of the five different areas (57% received advice on keeping the baby warm, 53% received advice on breastfeeding, 52% on the importance of institutional delivery, 42% on cord care, 37% on family planning).

How does appropriate antenatal care vary with schooling?

Percentage of last births in the past five years

Most women received the basic services needed to monitor their pregnancy. In Nagaland, more than 70 percent of women who received antenatal care for their last birth received each of the services needed to monitor their pregnancy: having their weight taken and their blood pressure measured (81% and 89%, respectively), having urine and blood samples taken (71% and 74%, respectively), and having their abdomen examined (85%).

An ultrasound test was performed during 35 percent of pregnancies in the five years preceding the survey. The percentage of women who had an ultrasound test increased sharply with increasing schooling. Seventy-one percent of women with at least 12 years of schooling had an ultrasound test compared with 15 percent of women with no schooling. Pregnant women with no sons are generally more likely to have an ultrasound test than those with at least one son. For example, 28 percent of pregnant women with three children and no sons had an ultrasound test, compared with 23 percent of those with one or more sons.

Delivery care

Only one-third of births take place in a health facility (mostly a government facility) and 67 percent take place at home. The percentage of births in a health facility almost tripled in the 10 years between NFHS-3 and NFHS-4, from 12 percent in NFHS-3 to 33 percent in NFHS-4. Institutional births are more common among women who had four or more antenatal care visits, women with 12 or more years of schooling, women in urban areas, women having their first birth, and women who do not belong to scheduled castes, scheduled tribes, or other backward classes.

For almost all home births (96%), a clean blade was used to cut the cord, as is recommended. A disposable delivery kit (DDK) was used for 64 percent of deliveries. Seventy-seven percent of home births followed the recommendation that the baby be immediately wiped dry and then wrapped without being bathed first.

Forty-one percent of births during the past five years took place with assistance from a skilled provider, 7 percent were delivered by a traditional birth attendant, and another 47 percent by friends/relatives.

In Nagaland, 6 percent of births during the past five years were delivered by caesarean section. Half of caesarean sections (3% of all births) were emergency caesarean sections.

Among women who had a live birth in the five years preceding the survey that was delivered in a health facility, 30 percent received financial assistance under the *Janani Suraksha Yojana* (JSY). Rural women were more likely than urban women to receive financial assistance under JSY. Scheduled tribe women were more likely than any other caste/tribe group of women to receive financial assistance under JSY.

Are babies being delivered safely?

Percentage of births in the past five years

Institutional Delivery by District

Percentage of births in the past five years

Only one-third of children in Nagaland born in the past five years were born in a health facility.

Postnatal care

Early postnatal care for a mother helps safeguard her health and can reduce maternal mortality. In Nagaland, 27 percent of mothers had a postnatal check after their last birth and 23 percent of mothers had a postnatal check within two days of the birth, as is recommended. Postnatal care is most common following births in a health facility; 60 percent of births in public health facilities and 68 percent of birth in private health facilities were followed by a postnatal check for the mother within two days of birth, compared with only 2 percent of home births.

Male involvement in maternal care

Two-thirds of men with a child under three years of age said that the youngest child's mother received antenatal care. Less than half of men (49%) with a child under three years said they were present during at least one antenatal check received by the child's mother (64% in urban areas and 41% in rural areas), but only 23 percent were told by a health provider or health worker what to do if the mother had a pregnancy complication. Only 20-24 percent of men were told about the signs of specific pregnancy complications (convulsions, vaginal bleeding, prolonged labour, high blood pressure, and severe abdominal pain).

Less than half of fathers with a child less than three years of age were given information by a health provider or health worker about various aspects of maternal care. Forty-nine percent were told about the importance of proper nutrition for the mother during pregnancy and 38 percent were told about the importance of delivering the baby in a health facility. Only 20 percent were told about family planning or delaying the next child. Only 42-45 percent of fathers whose child was not delivered in a health facility were told about the importance of cord care, the importance of keeping the baby warm immediately after birth, and the importance of breastfeeding the baby immediately after delivery.

CHILD HEALTH

Vaccination of children

Only 36 percent of children age 12-23 months received all basic vaccinations against six major childhood illnesses (tuberculosis, diphtheria, pertussis, tetanus, polio, and measles) at any time before the survey. However, most children are at least partially vaccinated; 19 percent have not received any vaccinations at all.

Sixty-eight percent of children have received a BCG vaccination. However, only half have received other basic vaccinations (53% have received at least the recommended three doses of polio vaccine, 52% have received the three recommended doses of DPT vaccine, and 50% have been vaccinated against measles). There is considerable dropout between the first and third doses of DPT vaccine (from 68% to 52%) and polio vaccine (from 77% to 53%).

Trends in Vaccination Coverage

Percentage of children 12-23 months receiving vaccinations

Between NFHS-3 and NFHS-4, there was substantial increase in vaccination coverage for three doses of DPT (from 29% to 52%), measles coverage (from 27% to 50%), and BCG coverage (from 46% to 68%), but coverage for three doses of polio vaccine increased much less, from 46 percent to 53 percent. Overall, there has been an increase in the coverage of all basic vaccinations (from 21% to 36%). In addition, over three-fifths of children (62%) have received at least the first dose of hepatitis B vaccine, but close to half of children (46%) have received all three recommended doses of hepatitis B vaccine.

Coverage of All Basic Vaccinations by District

Percentage of children 12-23 months

Coverage with all basic vaccinations is highest for children whose mothers have completed 12 or more years of schooling.

Coverage with all basic vaccinations is higher in urban areas than in rural areas (42% versus 33%) and is highest for children whose mothers have completed 12 or more years of schooling (56%) and for first births (42%). There is not much difference in vaccination coverage by the sex of the child.

Childhood illnesses

In the two weeks before the survey, 1 percent of children under age five years had symptoms of an acute respiratory infection (cough accompanied by (1) short, rapid breathing that is chest related and/or (2) difficult breathing that is chest related). Of these children, 31 percent were taken to a health facility or health provider.

Seven percent of children under age five were reported to have had fever in the two weeks preceding the survey; 31 percent of these children were taken to a health facility or provider for advice or treatment.

Overall, 5 percent of children under age five years had diarrhoea in the two weeks preceding the survey. Twenty-two percent of these children were taken to a health facility or health provider. In Nagaland, 68 percent of mothers of young children have heard of oral rehydration salt (ORS) packets for the treatment of diarrhoea, but only 41 percent of children with diarrhoea were given ORS. Twenty-three percent of children with diarrhoea were given gruel and more than half (54%) were given some type of oral rehydration therapy (ORT). Sixteen percent were given zinc supplements. One-third of children with diarrhoea did not receive any type of treatment at all.

To reduce dehydration and minimise the effects of diarrhoea on nutritional status, it is recommended that normal feeding of children be continued when they have diarrhoea and that the amount of fluids given should be increased. However, in Nagaland only 21 percent of children with diarrhoea received more to drink than normal. Forty-five percent of children received the same amount to drink as usual. Of greater concern, more than one-third of children with diarrhoea were given less to drink or nothing at all to drink. Half of children with diarrhoea were given the same amount of food or more food, as recommended. Less than half (43%) of children with diarrhoea were given ORT and continued feeding.

Integrated Child Development Services (ICDS)

The ICDS programme provides nutrition and health services for children under age six years and pregnant or breastfeeding women, as well as preschool activities for children age 3-5 years. These services are provided through community-based *anganwadi* centres (AWC).

Only 35 percent of children under 6 years receive services of some kind from an *anganwadi* centre. The most common service that age-eligible children receive is supplementary food (35%), followed by any immunizations (6%). The services that are least likely to be accessed are health check-ups (3%) and growth monitoring (4%). Very few mothers reported receiving benefits from an AWC either during pregnancy (9%) or while breastfeeding (8%). Among children who were weighed at an *anganwadi* centre, only 8 percent of mothers received counseling from an *anganwadi* worker or an ANM after the child was weighed.

How many children received *anganwadi* centre services?

Percentage of age-eligible children receiving services

BREASTFEEDING, NUTRITION, AND ANAEMIA

Infant feeding

Breastfeeding is nearly universal in Nagaland (96%), yet only 45 percent of children under 6 months are exclusively breastfed, as the World Health Organization (WHO) recommends. Eighty-six percent of children are put to the breast within the first day of life, but only 53 percent started breastfeeding in the first hour of life (as recommended). While the initiation of breastfeeding indicators show substantial improvement since NFHS-3, many infants are still deprived of the highly nutritious first milk (colostrum) and the antibodies it contains. Breastfeeding within one hour of birth varies widely across the state, from 40 percent in Phek to 70 percent in Mon.

WHO also recommends that nothing be given to children other than breastmilk even in the first three days when the milk has not begun to flow regularly because prelacteal feeds limit the frequency of suckling by the infant and expose the baby to the risk of infection. However, 31 percent of children in Nagaland are given something other than breastmilk during the first three days. Overall, 73 percent of children continue breastfeeding at 1 year and 40 percent continue breastfeeding at 2 years. The median duration of breastfeeding is 18.5 months, which is the age to which half of children are breastfed.

After the first 6 months, breastmilk is no longer enough to meet the nutritional needs of infants. Therefore, complementary foods should be added to the diet of the child. At age 6-8 months, 71 percent of children in Nagaland receive breastmilk and complementary foods.

WHO has several recommendations for infant and young child feeding (IYCF) practices for children age 6-23 months. The key IYCF indicators measure the adequacy of dietary diversity and meal frequency for breastfed and nonbreastfed children. Only 49 percent of children age 6-23 months are fed the recommended minimum number of times per day and even fewer (39%) are fed from the appropriate number of food groups. Only 19 percent are fed according to all three recommended IYCF practices.

Micronutrient deficiency is a major contributor to childhood morbidity and mortality. Vitamin A is an essential nutrient for the immune system. Severe vitamin A deficiency (VAD) can cause eye damage and a higher risk of dying from measles and diarrhoeal disease. The Government of India recommends that children under 5 years of age receive vitamin A supplements every six months, starting at age 9 months. In Nagaland, 30 percent of children age 9-59 months were given a vitamin A supplement in the past six months, and less than three-fourths of children (71%) age 9-23 months ate vitamin A-rich foods during the day or night before the survey.

Iron deficiency is a primary cause of anaemia. Eating foods rich in iron and taking iron supplements can help prevent anaemia. Nearly three-fifths of children (58%) age 9-23 months ate iron-rich foods during the day or night before the survey, and only 8 percent of children age 6-59 months were given iron supplements in the week before the survey.

Children’s nutritional status

Twenty-nine percent of children under age five years are stunted, or too short for their age, which indicates that they have been undernourished for some time. Eleven percent are wasted, or too thin for their height, which may result from inadequate recent food intake or a recent illness causing weight loss, and 4 percent are severely wasted. Seventeen percent are underweight, which takes into account both chronic and acute undernutrition. Four percent of children are overweight. Even during the first six months of life, when almost all babies are breastfed, 8 percent of children are stunted, 7 percent are underweight, and 14 percent are wasted.

Children’s nutritional status in Nagaland has improved since NFHS-3 by all measures. Stunting decreased from 39 percent to 29 percent in the 10 years between NFHS-3 and NFHS-4, and the percentage of children who are underweight decreased from 25 percent to 17 percent. However, in the same period, wasting decreased only slightly (from 13% to 11%). Despite the gains in stunting, wasting, and underweight, child malnutrition is still a problem in Nagaland.

Trends in Children’s Nutritional Status

Percentage of children under five years

Note: Nutritional status estimates are based on the 2006 WHO International Reference Population

The level of undernutrition is higher for boys than girls and is higher in rural areas than in urban areas. The differences are more pronounced for some other background characteristics. Undernutrition generally decreases with increasing mother’s schooling, better nutritional status of the mother, and larger child’s size at birth. The level of undernutrition is relatively high for children of higher birth orders.

Adults’ nutritional status

More than one-fourth of women (28%) and one-fourth of men are either too thin or overweight or obese. More men and women are overweight or obese than thin, which is the opposite of the pattern in NFHS-3. Twelve percent of women and 11 percent of men in Nagaland are too thin, and 16 percent of women and 14 percent of men are overweight or obese. About three-fourths of women and men are at a healthy weight for their height.

Undernutrition is particularly common in the younger age groups. Overweight and obesity are most prevalent in older adults, those in urban areas, and men with 12 or more years of schooling.

The use of iodized salt prevents iodine deficiency, which can lead to miscarriage, goitre, and mental retardation. Almost all of Nagaland’s households were using iodized salt at the time of the survey.

How many women are at a healthy weight for their height?

Percent distribution of women

Anaemia

Anaemia is a condition that is marked by low levels of haemoglobin in the blood. Iron deficiency is estimated to be responsible for about half of all anaemia globally, but anaemia can also be caused by malaria, hookworm and other helminths, other nutritional deficiencies, chronic infections, and genetic conditions. Anaemia can result in maternal mortality, weakness, diminished physical and mental capacity, increased morbidity from infectious diseases, perinatal

mortality, premature delivery, low birth weight, and (in children) impaired cognitive performance, motor development, and scholastic achievement. Anaemia is a major health problem in Nagaland, especially among women and children.

More than one-fifth (22%) of children age 6-59 months are anaemic. This includes 13 percent who are mildly anaemic, 8 percent who are moderately anaemic, and less than 1 percent who suffer from severe anaemia. Children of mothers who have anaemia are much more likely to be anaemic. Although anaemia levels vary somewhat according to background characteristics, anaemia among children is substantial in every group. One-sixth (16%) of children are anaemic even if their mother has 12 or more years of schooling.

Anaemia among women, men, and children

Twenty-four percent of women in Nagaland have anaemia, including 19 percent with mild anaemia, 5 percent with moderate anaemia, and less than 1 percent with severe anaemia. Anaemia is particularly high for women who are breastfeeding, but anaemia exceeds 20 percent for almost every group of women. Ten percent of the men are anaemic. Men aged 40-49 are particularly likely to be anaemic.

ADULT HEALTH AND HEALTH CARE

Tuberculosis

In Nagaland, 644 persons per 100,000 are estimated to have medically treated tuberculosis, based on reports from household respondents. The prevalence of medically treated tuberculosis is higher among men (785) than among women (497) and is higher in rural areas (691) than in urban areas (556).

Eighty-six percent of women and 87 percent of men have heard of tuberculosis, but even among those who have heard of tuberculosis, only 55 percent of women and 60 percent of men know that it is spread through the air by coughing or sneezing. Almost one-third of women and men have misconceptions about how tuberculosis is spread. Overall, 78 percent of women and 84 percent of men know that tuberculosis can be cured, and only 10 percent of women and 8 percent of men say that if a family member had tuberculosis, they would want to keep it a secret.

Diabetes, asthma, goitre, heart disease, and cancer

According to self-reports, 797 women age 15-49 and 1,030 men age 15-49 per 100,000 have diabetes. Overall, 1,273 women and 2,188 men per 100,000 suffer from asthma. Goitre or any other thyroid disease is less common than asthma (1,016 women per 100,000 and 32 men per 100,000).

The prevalence of any heart disease is 4.5 times as high among women (2,511 per 100,000) as among men (560 per 100,000). Among the five diseases, cancer is the least common, with 96 women per 100,000 and no men reportedly suffering from cancer.

Blood pressure (hypertension)

Seventeen percent of women age 15-49 in Nagaland have hypertension, including 11 percent with Stage 1 hypertension, 3 percent with Stage 2 hypertension, and 2 percent with Stage 3 hypertension. Almost half (48%) of women have normal blood pressure, including 0.4 percent of women with normal blood pressure who are taking medicine to lower their blood pressure. The prevalence of hypertension among men age 15-49 is somewhat higher than among women. Twenty-four percent of men in Nagaland have hypertension, including 17 percent with Stage 1 hypertension, 5 percent with Stage 2 hypertension, and 1 percent with Stage 3 hypertension. Twenty-eight percent of men have normal blood pressure, including 0.1 percent of men with normal blood pressure who are taking medicine to lower their blood pressure. For both women and men, hypertension tends to increase with age.

Blood glucose

NFHS-4 included measurement of random blood glucose among women age 15-49 and men age 15-54. Four percent of women age 15-49 in Nagaland have high blood glucose levels and an additional 3 percent have very high blood glucose levels. In comparison, 5 percent of men age 15-49 have high blood glucose levels and an additional 5 percent have very high blood glucose levels. Older women and men have relatively high blood glucose levels.

Health examinations

In Nagaland, only 15 percent of women have ever undergone an examination of the cervix, 2 percent have ever undergone a breast examination, and 14 percent have ever undergone an examination of the oral cavity.

Tobacco and alcohol use

Sixty-nine percent of men and 28 percent of women age 15-49 use some form of tobacco. Men are more likely to use *gutkha* or *paan masala* with tobacco (33%), to chew *paan* with tobacco (25%), to smoke *bidis* (24%), and to smoke cigarettes (21%) than to use other types of tobacco. Women are most likely to chew *paan* with tobacco and to use *gutkha* or *paan masala*. Almost half of men who smoke cigarettes or *bidis* (45%) smoked 10 or more cigarettes or *bidis* in the past 24 hours. Men are less likely to drink alcohol (39%) than to use tobacco, and only 3 percent of women say that they drink alcohol. Among men who drink alcohol, more than half (54%) drink alcohol at least once a week.

Source of health care

The public health sector is the main source of health care for about three-fifths of households (50% of urban households and 64% of rural households). Household members are more likely to go to private hospitals (30%) than private doctors or clinics (6%).

Health insurance

Despite the emergence of a number of health insurance programmes and health schemes, only 6 percent of households in Nagaland have any kind of health insurance that covers at least one member of the household. Health insurance coverage is somewhat more common in rural areas (7%) than in urban areas (4%). In Nagaland, the *Rashtriya Swasthya Bima Yojana* (RSBY) is the predominant health scheme/health insurance with a coverage of 70 percent among households in which at least one usual member is covered by a health scheme/health insurance.

Only 2 percent of women and 3 percent of men age 15-49 years in Nagaland are covered by any health scheme or health insurance.

HIV/AIDS

Awareness of HIV or AIDS

Eighty-nine percent of women in Nagaland have heard of HIV or AIDS. In urban areas, 96 percent know about HIV or AIDS, compared with 84 percent in rural areas. Women having no schooling are less likely (69%) than women with 12 or more years of schooling (100%) to have heard of HIV or AIDS. Women having no regular media exposure (79%) are less likely than women having regular media exposure (94%) to have heard of HIV or AIDS. Men are slightly more likely than women to know about HIV or AIDS. Ninety-two percent of men have heard of HIV or AIDS, including 96 percent in urban areas.

Knowledge of prevention and transmission

Men are much more likely than women to know how HIV/AIDS is transmitted and how to keep from getting it. For example, only 40 percent of women know that consistent condom use can help prevent HIV/AIDS, compared with 63 percent of men, and 43 percent of women know that having just one uninfected partner who has no other partners can reduce the chance of getting HIV/AIDS, compared with 59 percent of men.

Only 12 percent of women and 24 percent of men in Nagaland have a 'comprehensive knowledge' about HIV/AIDS. This means they know that consistent use of condoms every time they have sex and having just one uninfected sex partner who has no other partners can reduce the chance of getting HIV/AIDS, they know that a healthy-looking person can have HIV/AIDS, and they reject two common misconceptions about transmission or prevention of HIV/AIDS. About three-fourths of women and men know that HIV/AIDS can be transmitted from a mother to her baby.

Do people know how to prevent HIV/AIDS?

Percentage of women and men age 15-49

HIV-related stigma

Over three-fifths (61%) of women and 82 percent of men in Nagaland would be willing to take care of a relative with HIV/AIDS in their home. Two-thirds of women (66%) and 71 percent of men say that a female teacher who has HIV/AIDS but is not sick should be allowed to continue teaching. More than two-fifths (43%) of women and half of men say that they would buy fresh vegetables from a shopkeeper with HIV/AIDS. Fifty-six percent of women and 73 percent of men say that if a family member got infected with HIV/AIDS, they would not want to keep it a secret.

HIV testing prior to NFHS-4, blood transfusions, and safe injections

Twenty percent each of women and men age 15-49 had ever been tested for HIV prior to NFHS-4. Women and men in urban areas are more likely to have ever been tested for HIV prior to NFHS-4 than rural women and men. Almost one-fourth of women (24%) who had a live birth in the past five years and received ANC during pregnancy were tested for HIV during ANC. Urban women (31%) are more likely than rural women (18%) to have been tested for HIV during ANC.

Almost one-fourth (24%) of women who had a live birth in the past five years and received ANC during pregnancy were tested for HIV during ANC.

In Nagaland, men (15%) are more likely than women (6%) to have ever had a blood transfusion. Women are slightly more likely than men to have received an injection in the past 12 months (35% of women, compared with 33% of men).

For 91 percent of men and 96 percent of women who received an injection in the past 12 months, a disposable syringe was used.

SEXUAL BEHAVIOUR

NFHS-4 included questions on respondents' sexual behaviour. Respondents were asked about their age at first sex, their current and previous sexual partners, higher-risk intercourse and condom use. In addition, men were asked whether they had paid for sex in the past year. These questions are sensitive and subject to reporting bias, so the results should be interpreted with caution.

Higher-risk behaviour

Higher-risk sex is sexual intercourse with someone who is neither a spouse nor a cohabiting partner. Among those who had sex in the past 12 months, 4 percent of women and 17 percent of men reported having had higher-risk sex during the past 12 months. The percentage of men who had higher-risk sexual intercourse in the past 12 months is higher in urban areas than rural areas (20% in urban areas and 15% in rural areas). Even fewer respondents said that they had multiple sex partners in the past 12 months (0.3% of women and 2% of men).

One-third of men who had higher-risk sex in the past 12 months reported using a condom the last time they had higher-risk sex. Only 0.1 percent of men said they had paid for sex in the past 12 months.

WOMEN'S EMPOWERMENT

Women's hygiene

Using a hygienic method of menstrual protection is important for women's health and personal hygiene. In NFHS-4, young women age 15-24 were asked what method or methods they use for menstrual protection, if anything. In Nagaland, 71 percent of women age 15-24 use sanitary napkins, 58 percent use cloth, and 2 percent use locally prepared napkins. Overall, 73 percent of women age 15-24 use a hygienic method of menstrual protection. Women with at least 10 years of schooling are more than twice as likely to be using a hygienic method as women with no schooling or less than five years of schooling. Notably, only 49 percent of Muslim women use a hygienic method of menstrual protection, compared with 65 percent of Hindu and 74 percent of Christian women.

Employment and earnings

Only 34 percent of all women age 15-49 were employed in the 12 months preceding the survey; in the same period, 78 percent of all men age 15-49 were employed. Among employed women, 66 percent earned cash, including 16 percent whose earnings were in both cash and in-kind, and 27 percent were not paid at all. More than three-fourths of men who were employed earned cash (78%) and only 16 percent were not paid at all. Fifty-two percent of employed women worked in a non-agricultural occupation, compared with 57 percent of employed men.

Only 34 percent of all women age 15-49 were employed in the 12 months preceding the survey.

Among currently married women who work and are paid in cash, almost all (98%) decide how their earnings will be used, either alone or jointly with their husbands. More than two-fifths (41%) of women who work for cash say that they earn more or about the same as their husbands. By contrast, 87 percent of currently married men whose wives have cash earnings report that they alone or jointly with their wives decide how her earnings are used, and 37 percent of men who have cash earnings and whose wives have cash earnings say that their wife earns more or about the same as them.

Decision making

Currently married women were asked who makes decisions about their own health care, major household purchases, and visits to their own family or relatives. Overall, 94-95 percent of women participate in decisions about their own health care, visits to their own family and relatives, and major household purchases. Ninety-one percent of currently married women

participate in making all three of these decisions, and 3 percent do not participate in making any of the three decisions. Participation in all three decisions varies by age, increasing from 84 percent among women age 20-24 to more than 90 percent among women age 25-49.

Currently married men were also asked who makes decisions about their own health care and major household purchases. Men were less likely than women to report that they alone or jointly with their wife participated in these decisions; 89 percent participated in making decisions about their own health care and 92 percent participated in decisions about major household purchases.

Other indicators of women's empowerment

Thirty-two percent of women have some money that they can decide how to use. The proportion of women with money which they control is higher among urban than rural women, increases sharply with age, and is highest among women with 12 or more years of schooling (51%) and women who are employed for cash (74%) than any other group of women.

Almost two-fifths (39%) of women have a bank or savings account that they themselves use.

Almost two-fifths (39%) of women have a bank or savings account that they themselves use. This percentage is highest, at 87 percent, among women who have 12 or more years of schooling. Women's knowledge and use of microcredit programmes is very limited. Eighteen percent of women know of a microcredit programme in the area and only 3 percent have ever taken a loan from a microcredit programme.

Only 28 percent of women are allowed to go by themselves to all three of the following places: the market, a health facility, and places outside the village/community. The only groups of women in which more than two-fifths are allowed to go to all three places alone are employed women who earn cash.

Ownership of assets

Thirty-three percent of women and 63 percent of men own a house alone or jointly with someone else, and 25 percent of women and 58 percent of men own land alone or jointly with someone else. Ownership of both a house and land is more common in rural than urban areas for both women and men.

Thirty-three percent of women own a house alone or jointly with someone else, and 25 percent of women own land alone or jointly with someone else.

Seventy-one percent of women have a mobile phone that they themselves use, and among women who have a mobile phone that they themselves use, more than four in five (81%) can read SMS messages. Eighty-three percent of urban women have a mobile phone that they themselves use, compared with 62 percent of rural women. Only 36 percent of women having no schooling have a mobile phone they use, compared with 97 percent of women having 12 or more years of schooling.

More than 7 out of every 10 women have a mobile phone that they themselves use.

Gender-role attitudes

Forty-five percent of women believe it is justifiable for a husband to beat his wife under some circumstances. Women are most likely to believe that wife beating is justified if she neglects the house or children (32%), followed by if she shows disrespect for her in-laws (28%) or if she argues with her husband (20%). Men are less likely to agree: 35 percent say that wife beating is justified in some circumstances, especially if she neglects the house or children (23%), if the wife shows disrespect for in-laws (16%), or if she argues with him (16%). Even among those who have completed at least 12 years of schooling, 32 percent of women and 24 percent of men say that a husband is justified in beating his wife for one or more of the specified reasons.

Seventy percent of women and 61 percent of men believe that a woman is justified in refusing to have sex with her husband if she knows he has a sexually transmitted disease, if she knows he has intercourse with other women, and if she is tired or not in the mood. Almost 9 in 10 men (88%) agree that if a wife refuses to have sex with her husband he does not have a right to get angry and reprimand her, refuse to give her financial support, use force to have sex even if she doesn't want to, or have sex with another woman.

DOMESTIC VIOLENCE

Among women age 15-49, 12 percent have ever experienced physical violence and 6 percent have ever experienced sexual violence. In all, 15 percent of women in Nagaland have experienced physical or sexual violence. Among those who experienced physical violence since age 15, the most common perpetrator for ever-married women was their husband (74%).

Fifteen percent of women age 15-49 in Nagaland have experienced physical or sexual violence.

Violence during pregnancy

Two percent of women who have ever been pregnant have ever experienced physical violence during one or more of their pregnancies.

Spousal violence

Seven percent of ever-married women report having been slapped by their husband; 2-5 percent report being pushed, shaken, or having something thrown at them; having their arm twisted or hair pulled; being punched; or being kicked, dragged, or beaten up; and less than 1 percent each have experienced being choked or burned on purpose and being threatened or attacked with a knife, gun, or any other weapon. Five percent report that their husbands have physically forced them to have sex even when they did not want to and 2 percent report that their husband forced them with threats or other ways to perform sexual acts they did not want to perform.

Overall, 13 percent of ever-married women have experienced spousal physical or sexual violence from their current husband or, if not currently married, from their most recent husband. Ten percent report spousal emotional violence. Few ever-married women (2%) have ever initiated violence against their husband.

Although the prevalence of spousal violence is lower among more educated women, 8 percent of women who have at least 12 years of schooling have experienced physical or sexual spousal violence. Women whose husbands consume alcohol are much more likely than women whose husbands do not consume alcohol to experience spousal violence, especially if the husband often gets drunk. However, 5 percent of even women whose husbands do not drink alcohol have experienced physical or sexual spousal violence.

Is alcohol use related to spousal physical or sexual violence?

Percentage of ever-married women experiencing violence

Note: Category "Husband drinks alcohol, but never gets drunk" not shown since there are fewer than 25 unweighted cases.

Seventeen percent of women who have experienced spousal physical or sexual violence have suffered injuries as a result of the violence. The most common type of injury is cuts, bruises, or aches.

Help seeking

Only 14 percent of women who have ever experienced physical or sexual violence by anyone have sought help. About three-fourths of women (74%) have neither sought help nor told anyone about the violence.

Table 1 Results of the household and individual interviews

Number of households, number of interviews with women and men, and response rates, according to residence, Nagaland, 2015-16

Result	Residence		Total
	Urban	Rural	
Household interviews			
Households selected	3,567	8,321	11,888
Households occupied	3,438	8,056	11,494
Households interviewed	3,351	7,862	11,213
Household response rate ¹	97.5	97.6	97.6
Interviews with women age 15-49			
Number of eligible women	3,906	7,355	11,261
Number of eligible women interviewed	3,701	7,089	10,790
Eligible women response rate ²	94.8	96.4	95.8
Interviews with men age 15-54			
Number of eligible men	579	1,150	1,729
Number of eligible men interviewed	527	1,069	1,596
Eligible men response rate ²	91.0	93.0	92.3

Note: Eligible women and men are women age 15-49 and men age 15-54 who stayed in the household the night before the household interview (including both usual residents and visitors). This table is based on the unweighted sample.

¹ Households interviewed/households occupied

² Respondents interviewed/eligible respondents

Table 2 Results of the household and individual interviews by district

Number of households, number of women and men interviewed, and response rates by residence and district, Nagaland, 2015-16

na = Not applicable

¹ Nuclear households are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted, or fostered) with or without unrelated individuals.

² Protected dug well, protected spring, rainwater, community RO plant

³ Surface water, unprotected dug well, unprotected spring, cart with small tank, tanker truck, bottled water

⁴ Total may add to more than 100.0 because households may use more than one method of purification

⁵ Appropriate water treatment methods include boiling, bleaching, filtering, and electronic purifying

⁶ Includes ventilated improved pit (VIP)/biogas latrine and twin pit/composting toilet

⁷ Facilities that would be considered improved if they were not shared by two or more households

⁸ Includes dry toilet

⁹ Houses made from mud, thatch, or other low-quality materials are called *kachha* houses, houses that use partly low-quality and partly high-quality materials are called *semi-pucca* houses, and houses made with high quality materials throughout, including the floor, roof, and exterior walls, are called *pucca* houses.

¹⁰ Electricity, LPG/natural gas, or biogas

¹¹ Includes coal/lignite, charcoal, wood, straw/shrubs/grass, agricultural crop waste, and dung cakes

¹² Frequency of smoking by anyone inside the house

Table 5 Household possessions and land ownership

Percentage of urban, rural, and total households and *de jure* population possessing various household goods, means of transport, agricultural land, a house and farm animals and having a bank/post office account, health scheme/health insurance, a BPL card, and a long-lasting insecticide-treated (LLIN) mosquito net, Nagaland, 2015-16

Household possessions	Urban	Rural	Total	<i>De jure</i> population

30-34	0.082	0.130	0.110	0.110	0.156	0.142	0.162	0.131
35-39	0.045	0.074	0.063	0.053	0.130	0.112	0.076	0.059
40-44	0.011	0.026	0.021	0.031	0.047	0.042	0.023	0.015
45-49	0.000	0.012	0.008	(0.000)	(0.023)	0.016	(0.012)	0.006
TFR (15-49)	1.78	3.38	2.74	2.68	4.15	3.74	3.77	3.26
CBR	16.3	24.1	21.4	23.8	30.1	28.5	30.4	31.3

Note: Rates are for the period 1-36 months preceding the survey (approximately 1990-92 for NFHS-1, 1996-98 for NFHS-2, 2003-05 for NFHS-3, and 2013-15 for NFHS-4). Age-specific fertility rates are expressed per woman. Rates for the age group 45-49 might be slightly biased due to truncation.

TFR = Total fertility rate, expressed per woman

CBR = Crude birth rate, expressed per 1,000 population

() Based on 125-249 unweighted woman-years of exposure

Table 12 Fertility by background characteristics

Total fertility rate for the three years preceding the survey, percentage of women age 15-49 currently pregnant, mean number of children ever born to women age 40-49, and total wanted fertility rate by background characteristics, Nagaland, 2015-16

Background characteristic	Total fertility rate	Percentage of women age 15-49 currently pregnant	Mean number of children ever born to women age 40-49	Total wanted fertility rate
Residence

¹ Includes current pregnancy of woman/wife

² Want next birth within 2 years

³ Want to delay next birth for 2 or more years

⁴ For women: Includes both female and male sterilization and women who have had a hysterectomy

For men: Includes male sterilization and men who mention in response to the question about desire for children that their wife has been sterilized

Table 17 Desire not to have any more children

Percentage of currently married women and men age 15-49 who want no more children by number of living children, according to background characteristics, Nagaland, 2015-16, and by number of living children, NFHS-3

Table 27 Twelve-month contraceptive discontinuation rates

Among women age 15-49 who started an episode of contraceptive use within the five years preceding the survey, the percentage of episodes discontinued within 12 months, by reason for discontinuation and specific method, Nagaland, 2015-16

Method	Reason for discontinuation								Switched to another method ⁴	Number of episodes of use ⁵
	Method failure	Desire to become pregnant	Other fertility related reason ¹	Side effects/ health concerns	Wanted more effective method	Other method related reason ²	Other reason	Any reason ³		
Female sterilization	(0.0)	(0.0)	(0.0)	(0.0)	(0.0)	(0.0)	(0.0)	(0.0)	(0.0)	210
Pill	1.1	8.7	7.4	17.3	0.6	5.2	4.8	45.1	2.4	345
IUD or PPIUD	0.7	1.1	0.6	4.0	0.0	7.0	1.7	15.2	0.8	282
Condom/ <i>Nirodh</i>	(0.5)	(24.3)	(16.9)	(3.6)	(1.1)	(9.6)	(4.4)	(60.5)	(1.6)	184
Rhythm	(1.9)	(7.6)	(8.3)	(0.8)	(1.8)	(3.2)	(7.6)	(31.3)	(3.9)	167
Other ⁶	0.1	18.6	10.2	4.0	4.7	2.8	4.7	45.2	6.0	291
All modern spacing methods ⁷	0.8	9.7	7.2	10.3	0.9	6.7	3.5	39.1	2.1	842
All spacing methods ⁸	0.8	11.5	8.0	7.0	1.7	5.5	4.4	38.8	3.0	1,269
All methods	0.7	9.8	6.9	5.9	1.4	4.7	3.8	33.1	2.5	1,479

Note: Figures are based on life table calculations using information on episodes of contraceptive use that began 3-62 months preceding the survey. All methods includes male sterilization, which is not shown separately.

IUD = Intrauterine device; PPIUD = Postpartum intrauterine device

¹ Includes infrequent sex/husband away, difficult to get pregnant/menopausal, and marital dissolution/separation

² Includes lack of access/too far, costs too much, and inconvenient to use

³ Reasons for discontinuation are mutually exclusive and add to the total in this column

⁴ The episodes of use included in this column are a subset of the discontinued episodes included in the discontinuation rate. A woman is considered to have switched to another method if she used a different method in the month following discontinuation or if she gave "wanted a more effective method" as the reason for discontinuation and started another method within two months of discontinuation.

⁵ Number of episodes of use includes both episodes of use that were discontinued during the period of observation and episodes of use that were not discontinued during the period of observation

⁶ Includes injectables, female condom, diaphragm, foam/jelly, standard days method, LAM, withdrawal, and other modern and traditional methods that are not shown separately

⁷ Includes other modern spacing methods that are not shown separately

⁸ Includes other spacing methods that are not shown separately

() Based on 25-49 unweighted cases

Table 28 Men's contraception-related perceptions and knowledge

Percentage of men age 15-49 who agree with two specific statements about women and contraception, and percent distribution of men according to their belief about the efficacy of condoms in preventing pregnancy, by background characteristics, Nagaland, 2015-16

Background characteristic	Percentage of men who agree		Percentage of men who say that if a male condom is used correctly, it protects against pregnancy:					Number of men
	Contraception is women's business and a man should not have to worry about it	Women who use contraception may become promiscuous	Most of the time	Some-times	Not at all	Don't know/ unsure ¹	Total

Table 29 Need and demand for family planning among currently married women – Continued

Percentage of currently married women age 15-49 with unmet need for family planning, percentage with met need for family planning, the total demand for family planning and the percentage of the demand for contraception that is satisfied, by background characteristics, Nagaland, 2015-16

Background characteristic	Unmet need for family planning			Met need for family planning (currently using)			Total demand for family planning ¹			Percentage of demand satisfied by modern methods ³	Number of women
	For spacing	For limiting	Total	For spacing	For limiting	Total	For spacing	For limiting	Total		
Caste/tribe											
Scheduled caste	5.8	16.9	22.7	3.2	24.0	27.2	9.0	40.9	49.9	45.6	380
Scheduled tribe	11.7	10.1	21.9	3.8	22.3	26.0	15.5	32.4	47.9	43.1	5,794
Other backward class	(8.8)	(8.4)	(17.2)	(4.7)	(28.7)	(33.4)	(13.4)	(37.1)	(50.5)	(66.0)	59
Other	7.9	17.0	24.9	10.4	27.5	37.8	18.3	44.4	62.8	50.7	322
Don't know	(20.9)	(21.8)	(42.7)	(5.1)	(13.2)	(18.3)	(26.0)	(35.1)	(61.0)	(30.0)	42
Total	11.2	10.9	22.2	4.1	22.6	26.7	15.3	33.5	48.8	54.6	6,597

Note: Numbers in this table correspond to the revised definition of unmet need described in Bradley et al., 2012, Revising Unmet Need for Family Planning, DHS Analytical Studies No. 25, ICF International, Calverton, Maryland, USA. Unmet need for family planning refers to fecund women who are not using contraception but who wish to postpone the next birth (spacing) or stop childbearing altogether (limiting). Specifically, women are considered to have unmet need for spacing if they are: at risk of becoming pregnant, not using contraception, and either do not want to become pregnant within the next two years, or are unsure if or when they want to become pregnant; pregnant with a mistimed pregnancy; postpartum amenorrhoeic for up to two years following a mistimed birth and not using contraception. Women are considered to have unmet need for limiting if they are: at risk of becoming pregnant, not using contraception, and want no (more) children; pregnant with an unwanted pregnancy; postpartum amenorrhoeic for up to two years following an unwanted birth and not using contraception. Women who are classified as infecund have no unmet need because they are not at risk of becoming pregnant. Unmet need for family planning is the sum of unmet need for spacing and unmet need for limiting.

¹ Total demand is the sum of unmet need and met need

² Percentage of demand satisfied is met need divided by total demand

³ Modern methods include female sterilization, male sterilization, pill, IUD/PIUD, injectables, male condom, female condom, standard days method, diaphragm, foam/jelly, lactational amenorrhoea method (LAM), and other modern methods

() Based on 25-49 unweighted cases

Table 30 Unmet need for family planning by district

Percentage of currently married women age 15-49 with unmet need for family planning by district, Nagaland, 2015-16 and total for NFHS-3

District	Total unmet need	Unmet need for spacing	Unmet need for limiting	Number of women
Dimapur	24.2	9.7	14.4	1,664
Kiphire	17.7	11.1	6.6	307
Kohima	19.8	10.7	9.1	715
Longleng	16.8	9.1	7.8	183
Mokokchung	18.1	10.0	8.1	472
Mon	22.3	13.5	8.8	995
Peren	25.3	13.9	11.5	271
Phek	22.9	7.3	15.6	561
Tuensang	26.4	16.4	10.0	619
Wokha	24.0	16.2	7.9	325
Zunheboto	17.8	7.8	10.1	486
Nagaland	22.2	11.2	10.9	6,597
NFHS-3 (2005-06)	28.4	10.0	18.4	2,354

Note: Numbers in this table correspond to the revised definition of unmet need described in Bradley et al., 2012, Revising Unmet Need for Family Planning, DHS Analytical Studies No. 25, ICF International, Calverton, Maryland, USA. Unmet need for family planning refers to fecund women who are not using contraception but who wish to postpone the next birth (spacing) or stop childbearing altogether (limiting). Specifically, women are considered to have unmet need for spacing if they are: at risk of becoming pregnant, not using contraception, and either do not want to become pregnant within the next two years, or are unsure if or when they want to become pregnant; pregnant with a mistimed pregnancy; postpartum amenorrhoeic for up to two years following a mistimed birth and not using contraception. Women are considered to have unmet need for limiting if they are: at risk of becoming pregnant, not using contraception, and want no (more) children; pregnant with an unwanted pregnancy; postpartum amenorrhoeic for up to two years following an unwanted birth and not using contraception. Women who are classified as infertile have no unmet need because they are not at risk of becoming pregnant. Unmet need for family planning is the sum of unmet need for spacing and unmet need for limiting.

Table 31 Pregnancy outcome

Percent distribution of last pregnancies among women age 15-49 during the five years preceding the survey by pregnancy outcome, according to background characteristics, Nagaland, 2015-16

Background characteristic	Pregnancy outcome				Total	Number of pregnancies
	Live birth	Abortion	Miscarriage	Stillbirth		
Mother's current age						
15-19	92.4	5.3	1.0	1.2	100.0	77

Total	16.4	13.1	29.5	8.1	37.3

¹ Computed as the difference between the infant and neonatal mortality rates

² Excludes first-order births

() Based on 250-499 unweighted person-years of exposure to the risk of death

Table 36 High-risk fertility behaviour

Percent distribution of children born in the five years preceding the survey by category of elevated risk of mortality and the risk ratio, and percent distribution of currently married women by category of risk if they were to conceive a child at the time of the survey, Nagaland, 2015-16

Risk category	Births in the 5 years preceding the survey		Percentage of currently married women ¹
	Percentage of births	Risk ratio	
Not in any high-risk category	25.2	1.0	25.0 ^a
Unavoidable risk category			
First order births between ages 18 and 34 years	27.7	0.7	6.1
Single high-risk category			
Mother's age <18	2.0	2.3	0.2
Mother's age >34	3.4	1.4	12.7
Birth interval <24 months	13.2	1.0	8.7
Birth order >3	13.8	0.5	10.8
Subtotal	32.4	0.9	32.3
Multiple high-risk category			
Mother's age <18 and birth interval <24 months ³	0.3	*	0.1
Mother's age >34 and birth interval <24 months	0.6	(1.2)	0.7
Mother's age >34 and birth order >3	6.9	1.6	28.4
Mother's age >34 and birth interval <24 months and birth order >3	1.3	1.4	2.1
Birth interval <24 months and birth order >3	5.4	1.2	5.3
Subtotal	14.6	1.4	36.6
In any avoidable high-risk category	47.0	1.1	68.9
Total	100.0	na	100.0
Number of births	4,527	na	6,597

Note: Risk ratio is the ratio of the proportion dead among births in a specific high-risk category to the proportion dead among births not in any high-risk category.

na = Not applicable

¹ Women are assigned to risk categories according to the status they would have at the birth of a child if they were to conceive at the time of the survey: current age less than 17 years and 3 months or greater than 34 years and 2 months, latest birth less than 15 months ago, or latest birth of order 3 or higher

² Includes the category age <18 and birth order >3

^a Includes sterilized women

() Based on 25-49 unweighted cases

* Risk ratio not shown; based on fewer than 25 unweighted cases

Table 37 Antenatal care

Percent distribution of women who had a live birth in the five years preceding the survey by antenatal care (ANC) provider during pregnancy for the most recent live birth and percentage receiving ANC from a skilled provider, according to background characteristics, Nagaland, 2015-16

Background characteristic	Doctor	ANM/ nurse/ midwife/ LHV	<i>Dai</i> (TBA)	Community/ village health worker	Anganwadi/ ICDS worker	ASHA	No one	Total	Number of women	Percentage receiving ANC from a skilled provider ¹

Total	35.6	8.4	0.8	0.2	0.2	1.0	53.8	100.0	3,105	44.0

Note: If more than one source of ANC was mentioned, only the provider with the highest qualification is considered in this table. Total includes women belonging to "other" religions, other backward class women, and women who don't know their caste/tribe, who are not shown separately.

ANM = Auxiliary nurse midwife; LHV = Lady health visitor; TBA = Traditional birth attendant; ICDS = Integrated Child Development Services; ASHA = Accredited Social Health Activist

¹ Skilled provider includes doctor, auxiliary nurse midwife, nurse, midwife, and lady health visitor

² Not belonging to a scheduled caste, scheduled tribe, or other backward class

Table 38 Antenatal care services and information received

Percentage of women who had a live birth in the five years preceding the survey who received antenatal care (ANC) for the most recent live birth by services and information received, according to residence and source of antenatal care, Nagaland, 2015-16

Services/information	Residence		Source of ANC			Total
	Urban	Rural	Public health sector	Private health sector ¹	ANC received only at home	
Percentage receiving selected services during antenatal care						
Weighed	84.8	78.9	84.6	82.0	29.8	81.2
Blood pressure measured	93.4	86.4	92.0	91.0	40.3	89.2
Urine sample taken	78.8	65.0	71.0	75.7	30.6	70.5
Blood sample taken	80.8	69.3	74.3	79.4	31.9	73.9
Abdomen examined	91.1	80.4	83.7	92.6	42.7	84.6
Percentage receiving information on specific pregnancy complications						
Vaginal bleeding	24.2	17.3	18.7	23.9	9.9	20.0
Convulsions	23.7	20.9	20.1	26.8	15.1	22.0

Other ³	21.1	32.4	68.4	71.6	46.0	9.5	4.6	4.2	151
Total	15.0	24.9	59.6	63.9	42.0	4.4	2.4	1.8	3,105

Note: Total includes women belonging to "other" religions, other backward class women, and women who don't know their caste/tribe, who are not shown separately.

TT = Tetanus toxoid; IFA = Iron and folic acid

¹ Includes mothers with two injections during the pregnancy for her last birth, or two or more injections (the last within 3 years of the last live birth), or three or more injections (the last within 5 years of the last birth), or four or more injections (the last within 10 years of the last live birth), or five or more injections at any time prior to the last birth

² Full antenatal care includes having received at least four antenatal care visits, having received at least one TT injection, and having taken IFA tablets or syrup for 100 or more days

³ Not belonging to a scheduled caste, scheduled tribe, or other backward class

Table 40 Antenatal care indicators by district

Among women with a live birth in the five years preceding the survey, percentage who received different types of antenatal care (ANC) during the pregnancy for their most recent live birth, and among women with registered pregnancies, percentage who received a Mother and Child Protection Card (MCP Card), by district, Nagaland, 2015-16

District	Percentage who had four or more ANC visits	Percentage with an ANC visit in the first trimester of pregnancy	Percentage who took IFA for at least 100 days	Percentage who received two or more TT injections during the pregnancy	Percentage who had full antenatal care ¹	Number of women	Percentage of women who received an MCP Card	Number of registered pregnancies
Dimapur	26.5	34.6	7.7	74.0	4.5	755	64.8	397
Kiphire	2.0	14.1	1.4	48.1	0.0	154	72.6	51

Total	0.3	1.6	0.1	0.5	0.2	0.2	97.0	100.0	2.5	3,105

Note: Total includes information on births delivered in an "other" place of delivery, births belonging to "other" religions, births belonging to other backward class or whose caste/tribe is not known, which is not shown separately.

¹ Includes newborns who received a health check after the first week

² Includes nongovernmental organizations or trust hospitals/clinics

³ Not belonging to a scheduled caste, scheduled tribe, or other backward class

Table 50 Trends in maternal care indicators

Maternal care indicators for births during the three years preceding the survey by residence, NFHS-4 and NFHS-3, Nagaland

Indicator	NFHS-4 (2015-16)	NFHS-3 (2005-06)
URBAN		
Percentage who received antenatal care ¹	63.3	84.2
Percentage who had at least four antenatal care visits ¹	31.1	29.7
Percentage who received antenatal care within the first trimester of pregnancy ¹	37.1	50.2
Percentage who received full antenatal care ^{1,2}	5.2	2.3
Percentage of births delivered in a health facility ³	61.1	31.9
Percentage of deliveries assisted by health personnel ^{3,4}	69.1	54.3
RURAL		
Percentage who received antenatal care ¹	40.1	48.7
Percentage who had at least four antenatal care visits ¹	9.8	6.1
Percentage who received antenatal care within the first trimester of pregnancy ¹	19.8	21.9
Percentage who received full antenatal care ^{1,2}	1.6	0.2
Percentage of births delivered in a health facility ³	26.7	6.7
Percentage of deliveries assisted by health personnel ^{3,4}	35.8	17.9
TOTAL		
Percentage who received antenatal care ¹	46.5	56.7
Percentage who had at least four antenatal care visits ¹	15.6	11.5
Percentage who received antenatal care within the first trimester of pregnancy ¹	24.6	28.4
Percentage who received full antenatal care ^{1,2}	2.6	0.6
Percentage of births delivered in a health facility ³	35.7	12.2
Percentage of deliveries assisted by health personnel ^{3,4}	44.5	25.9

¹ Based on the last birth to women in the three years preceding the survey

² Full antenatal care includes having received at least four antenatal care visits , having received at least one tetanus toxoid (TT) injection, and having taken iron and folic acid (IFA) tablets or syrup for 100 or more days

³ Based on all births in the three years preceding the survey

⁴ Doctor, auxiliary nurse midwife (ANM), nurse, midwife, lady health visitor (LHV), or other health personnel

Table 51 Male involvement in maternal care: Men's report

Among men age 15-49 whose youngest living child was age 0-35 months, percentage for whom the youngest child's mother received antenatal care, percentage who were present for at least one antenatal check-up, percentage who were told by a health provider or worker at any time during the pregnancy about specific signs of pregnancy complications, percentage to whom a health provider or worker spoke about specific aspects of maternal care at any time during the pregnancy, and percentage whose youngest child was delivered in a health facility, and among men with a child age 0-35 months whose youngest living child was not delivered in a health facility, percentage who were given specific home delivery related information, by residence, Nagaland, 2015-16

Antenatal and delivery care information	Urban	Rural	Total
Percentage of men for whom the youngest child's mother received antenatal care	86.7	57.3	66.8
Percentage of men who were present at any antenatal check-up	64.0	41.2	48.5
Percentage who were told by a health provider or worker about the following signs of pregnancy complications:			
Vaginal bleeding	20.4	19.1	19.5
Convulsions	24.4	18.4	20.4
Prolonged labour	29.6	21.5	24.1
Severe abdominal pain	26.3	19.8	21.9
High blood pressure	26.3	18.8	21.2
Percentage ever told what to do if the mother had any pregnancy complications	28.3	20.2	22.8
Percentage whose youngest child age 0-35 months was delivered in a health facility	68.3	26.2	39.8
Percentage to whom a health provider or worker spoke about the following aspects of maternal care:			
The importance of delivering in a health facility	47.4	34.1	38.4
The importance of proper nutrition for the mother during pregnancy	56.2	45.8	49.1
Family planning or delaying his next child	26.3	16.8	19.9
Number of men with a youngest child age 0-35 months	107	225	331
Among men whose last child age 0-35 months was not delivered in a health facility, percentage who were told the importance of:			
Cord care	(32.0)	43.7	41.7
Breastfeeding the baby immediately after delivery	(45.4)	40.7	41.5
Keeping the baby warm immediately after birth	(46.8)	44.8	45.1
Number of men whose youngest child age 0-35 months was not delivered in a health facility	34	166	200

() Based on 25-49 unweighted cases

Mother's nutritional status⁸											
Underweight (BMI < 18.5)	12.7	33.4	-1.3	4.1	14.1	4.0	6.6	23.5	0.7	-1.2	432
Normal (BMI 18.5-24.9)	10.6	28.9	-1.1	4.8	11.8	3.6	4.6	17.1	1.3	-0.9	2,924
Overweight (BMI ≥ 25.0)	6.7	21.8	-0.9	1.4	6.7	4.5	1.1	10.2	1.0	-0.6	499
Missing	(15.1)	(37.6)	(-1.7)	(0.0)	(4.2)	(5.7)	(5.6)	(18.3)	(3.2)	(-1.1)	33
Child's living arrangements											
Living with both parents	10.6	29.1	-1.1	4.2	11.2	3.9	4.6	17.2	1.3	-1.0	3,592
Living with one or neither parent	7.8	24.4	-0.9	3.7	11.1	3.0	2.3	13.2	0.6	-0.7	450
Total	10.3	28.6	-1.1	4.2	11.2	3.8	4.4	16.8	1.2	-0.9	4,042
NFHS-3 (2005-06)	19.3	38.8	-1.4	5.2	13.3	4.7	7.1	25.2	0.8	-1.2	1,941

Note: Table is based on children who stayed in the household the night before the interview. Each of the indices is expressed in standard deviation units (SD) from the median of the WHO Child Growth Standards adopted in 2006. The indices in this table are NOT comparable to those based on the previously used 1977 NCHS/CDC/WHO Reference. Table is based on children with valid dates of birth (month and year) and valid measurement of both height and weight. Total includes children belonging to "other" religions and other backward class children, who are not shown separately.

- ¹ Recumbent length is measured for children under age 2, or in the few cases when the age of the child is unknown and the child is less than 85 cm; standing height is measured for all other children
- ² Includes children who are below -3 standard deviations (SD) from the WHO Child Growth Standards population median
- ³ Excludes children whose mothers were not interviewed
- ⁴ First born twins (triplets, etc.) are counted as first births because they do not have a previous birth interval
- ⁵ For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the household schedule.
- ⁶ Not belonging to a scheduled caste, scheduled tribe, or other backward class
- ⁷ Includes children whose mothers are deceased
- ⁸ Excludes children whose mothers were not weighed and measured, children whose mothers were pregnant or gave birth within the preceding 2 months. Mother's nutritional status in terms of BMI (body mass index) is presented in Table 70.

() Based on 25-49 unweighted cases

Table 61 Initial breastfeeding

Among last-born children who were born in the two years preceding the survey, the percentage who were ever breastfed, and the percentage who started breastfeeding within one hour and one day of birth, and among last-born children born in the two years preceding the survey who were ever breastfed, the percentage who received a prelacteal feed, by background characteristics, Nagaland, 2015-16

Background characteristic	Among last-born children born in the past two years:				Among last-born children born in the past two years who were ever breastfed:

Total includes children belonging to "other" religions, other backward class children, children whose caste/tribe is not known, and children who were delivered in an "other" place of delivery, who are not shown separately.

TBA = Traditional birth attendant

¹ Includes children who started breastfeeding immediately after birth

² Includes children who started breastfeeding within one hour of birth

³ Children given something other than breastmilk during the first three days of life

⁴ Not belonging to a scheduled caste, scheduled tribe, or other backward class

⁵ Doctor, nurse, midwife, auxiliary nurse midwife, lady health visitor, or other health personnel

() Based on 25-49 unweighted cases

Table 6.2 Breastfeeding status by age

Percent distribution of youngest children under two years living with the mother by breastfeeding status, percentage currently breastfeeding, and percentage of all children under two years using a bottle with a nipple, according to age in months, Nagaland, 2015-16

Age in months	Breastfeeding and consuming:						Total	Percentage currently breastfeeding	Number of youngest children under two years living with the mother	Percentage using a bottle with a nipple	Number of all children under two years
	Not breastfeeding	Exclusively breastfed	Plain water only	Non-milk liquids/juice	Other milk	Complementary foods					
<2	7.4	58.8	21.0	2.0	0.9	9.8	100.0	92.6	80	6.5	81
2-3	4.1	51.0	22.1	1.0	4.1	17.7	100.0	95.9	149	7.1	149
4-5	6.5	32.1	22.3	1.6	3.4	34.0	100.0	93.5	171	13.0	171
6-8	3.4	11.0	10.4	0.6	4.0	70.5	100.0	96.6	251	25.9	252
9-11	8.9	4.6	4.4	0.0	1.5	80.6	100.0	91.1	207	33.8	209
12-17	29.3	0.9	5.0	0.7	1.4	62.7	100.0	70.7	458	42.8	474
18-23	57.7	1.5	1.1	0.0	0.4	39.3	100.0	42.3	338	35.9	384
<4	5.3	53.7	21.7	1.4	2.9	14.9	100.0	94.7	228	6.9	230
<6	5.8	44.5	22.0	1.5	3.2	23.1	100.0	94.2	399	9.5	401
6-9	4.4	10.1	9.0	0.4	3.3	72.7	100.0	95.6	338	28.2	339
12-15	27.2	0.8	6.2	1.0	1.7	63.1	100.0	72.8	319	42.8	326
12-23	41.4	1.2	3.3	0.4	0.9	52.7	100.0	58.6	796	39.7	859
20-23	60.2	1.2	1.3	0.0	0.6	36.8	100.0	39.8	214	34.2	255

Note: Breastfeeding status refers to a "24-hour" period (yesterday and last night). Children who are classified as breastfeeding and consuming plain water only consumed no liquid or solid supplements. The categories of not breastfeeding, exclusively breastfed, breastfeeding and consuming plain water, non-milk liquids/juice, other milk, and complementary foods (solids and semi-solids) are hierarchical and mutually exclusive, and their percentages add to 100 percent. Thus children who receive breastmilk and non-milk liquids and who do not receive other milk and who do not receive complementary foods are classified in the non-milk liquid category even though they may also get plain water. Any children who get complementary food are classified in that category as long as they are breastfeeding as well.

Table 63. Median duration of breastfeeding and infant and young child feeding (IYCF) practices

Background characteristic	Median duration (months) of breastfeeding among last-born children born in the last three years ¹		Among breastfed children 6-23 months, percentage fed:		Among nonbreastfed children 6-23 months, percentage fed:		Among all children 6-23 months, percentage fed:

Note: Total includes children belonging to "other" religions and children whose caste/tribe is not known, who are not shown separately.

a = Omitted because the smoothed percentage is below 50% in the first age cell (<2 months) and therefore the median cannot be calculated
na = Not applicable

¹ Median durations are based on the distributions at the time of the survey of the proportion of births by months since birth. Includes children living and deceased at the time of the survey. It is assumed that children not currently living with the mother are not currently breastfeeding.

² Either exclusively breastfed or received breastmilk and plain water and/or non-milk liquids only

³ Food groups are: a. infant formula, milk other than breastmilk, cheese or yogurt or other milk products; b. foods made from grains or roots, including porridge or gruel, fortified baby food; c. vitamin A-rich fruits and vegetables; d. other fruits and vegetables; e. eggs; f. meat, poultry, fish, shellfish, or organ meats; g. beans, peas, lentils, or nuts; h. foods made with oil, fat, ghee, or butter

⁴ Receiving solid or semi-solid food at least twice a day for breastfed infants 6-8 months and at least three times a day for breastfed children 9-23 months

⁵ Includes two or more feedings of commercial infant formula, fresh, tinned and powdered animal milk, and yogurt

⁶ Nonbreastfed children age 6-23 months are considered to be fed with a minimum standard of three Infant and Young Child Feeding Practices if they receive other milk or milk products at least twice a day, receive the minimum meal frequency, and receive solid or semi-solid foods from at least four food groups not including the milk or milk products food group

⁷ Breastfeeding, or not breastfeeding and receiving two or more feedings of commercial infant formula, fresh, tinned, and powdered animal milk, and yogurt

⁸ Children are fed the minimum recommended number of times per day according to their age and breastfeeding status as described in footnotes 4 and 6.

() Based on 25-49 unweighted cases

* Based on fewer than 25 unweighted cases

Table 64 Child feeding practices and nutritional status of children by district

Among last-born children in the past 2 years, percentage breastfed within one hour of birth, percentage of youngest children under age 6 months living with the mother who are exclusively breastfed, and percentage of children under age five years classified as malnourished according to three anthropometric indices of nutritional status: height-for-age, weight-for-height, and weight-for-age, by district, Nagaland, 2015-16

District	Among last-born children in the past 2 years		Number of children	Percentage of children under age 6 months exclusively breastfed ¹	Height-for-age ²		Weight-for-height		Weight-for-age	
	Percentage breastfed within one hour of birth	Number of children			Percentage below -2 SD ³	Number of children	Percentage below -2 SD ³	Percentage below -2 SD ³	Number of children	Percentage below -2 SD ³

Table 65 Prevalence of anaemia in children – *Continued*

Percentage of children age 6-59 months classified as having anaemia, by background characteristics, Nagaland, 2015-16

Background characteristic	Anaemia status by haemoglobin level			Any anaemia (<11.0 g/dl)	Number of children
	Mild (10.0-10.9 g/dl)	Moderate (7.0-9.9 g/dl)	Severe (<7.0 g/dl)		
Child's living arrangements					
Living with both parents	13.5	8.5	0.3	22.3	3,274
Living with one or neither parent	10.0	5.0	1.2	16.2	421
Mother's anaemia status⁵					
Not anaemic	10.9	6.7	0.3	17.8	2,462
Mildly anaemic	17.4	12.0	0.7	30.1	802
Moderately/severely anaemic	21.2	12.5	0.1	33.8	236
Total	13.1	8.1	0.4	21.6	3,696

Note: Table is based on children who stayed in the household the night before the interview. Prevalence of anaemia, based on haemoglobin levels, is adjusted for altitude using the CDC formulas (Centers for Disease Control (CDC). 1998. Recommendations to prevent and control iron deficiency in the United States. *Morbidity and Mortality Weekly Report* 47 (RR-3): 1-29). Haemoglobin levels shown in grams per decilitre (g/dl). Total includes children belonging to "other" religions and other backward class children, who are not shown separately.

¹ Excludes children whose mothers were not interviewed

² For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the household schedule.

³ Not belonging to a scheduled caste, scheduled tribe, or other backward class

⁴ Includes children whose mothers are deceased

⁵ Mildly anaemic is classified as 10.0-11.9 g/dl for non-pregnant women and 10.0-10.9 g/dl for pregnant women. Moderately/severely anaemic is <10.0 g/dl. Adjusted for altitude and for smoking status. Excludes children whose mother's anaemia status is not known.

() Based on 25-49 unweighted cases

Table 66 Micronutrient intake among children

Percentage of youngest children age 9-23 months living with the mother who consumed vitamin A-rich and iron-rich foods in the day or night preceding the survey, percentage of children age 9-59 months who were given vitamin A supplements in the six months preceding the survey and percentage of children age 6-59 months who were given iron supplements in the past seven days, who were given deworming medication in the six months preceding the survey, and who live in households using iodized salt, by background characteristics, Nagaland, 2015-16, and total for NFHS-3

Note: Information on iron supplements and deworming medication is based on the mother's recall. Information on vitamin A supplementation is based on the vaccination card (where available) and mother's recall. Total includes children belonging to "other" religions and other backward class children, who are not shown separately.

na = Not applicable

¹ Includes meat and organ meats, fish, poultry, eggs, pumpkin, carrots, squash, and sweet potatoes that are yellow or orange inside, dark green leafy vegetables, ripe mango, papaya, cantaloupe, and jackfruit

² Includes meat and organ meats, fish, poultry, or eggs

³ Deworming for intestinal worms

⁴ Excludes children in households in which salt was not tested. Includes children whose mothers were not interviewed except for birth order, breastfeeding status, and mother's schooling. For mother's schooling, excludes children whose mothers are not listed in the household schedule.

⁵ Not belonging to a scheduled caste, scheduled tribe, or other backward class

() Based on 25-49 unweighted cases

* Percentage not shown; based on fewer than 25 unweighted cases

Table 67 Presence of iodized salt in household

Percentage of households with salt tested for iodine content that have iodized salt, according to background characteristics, Nagaland, 2015-16, and total for NFHS-3

Background characteristic	Among households with tested salt:	
	Percentage with iodized salt	Number of households
Residence

SBP = Systolic blood pressure; DBP = Diastolic blood pressure

¹ A woman is classified as having hypertension if she has SBP ≥140 mmHg or DBP ≥90 mmHg at the time of the survey, or she is currently taking antihypertension medication to control her blood pressure. The term hypertension as used in this table is not meant to be a clinical diagnosis of the disease, but rather to provide an indication of the disease burden in the population at the time of the survey.

() Based on 25-49 unweighted cases

Table 99 Spousal violence by husband's characteristics and empowerment indicators – *Continued*

Percentage of ever-married women age 15-49 who have ever suffered emotional, physical, or sexual violence committed by their husband, according to his characteristics, marital characteristics, and selected empowerment indicators, Nagaland, 2015-16

Background characteristic	Emotional violence	Physical violence	Sexual violence	Physical or sexual violence	Emotional, physical, or sexual violence	Number of women
Number of reasons given for refusing to have sexual intercourse with husband⁵						
0	9.0	11.4	5.3	11.4	13.4	88
1-2	9.9	9.1	7.2	14.0	17.9	153
3	9.8	10.1	5.8	12.5	16.3	522
Afraid of husband						
Most of the time	(35.4)	(35.4)	(27.7)	(42.6)	(48.3)	29
Sometimes	10.2	10.9	6.6	14.2	18.4	486
Never	5.9	5.3	2.4	6.4	8.4	248
Total	9.7	10.0	6.0	12.7	16.3	763

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women. Total includes women whose husbands drink alcohol, but never get drunk, women whose husbands displayed 5-6 marital control behaviours, and women who do not participate in any of the three decisions, who are not shown separately.

¹ Currently married women only

² Behaviours include: Is jealous or angry if she talks to other men, frequently accuses her of being unfaithful, does not permit her to meet her female friends, tries to limit her contact with her family, insists on knowing where she is at all times, and does not trust her with any money

³ Currently married women only. Decisions included are decisions about her own health care, major household purchases, and visits to her family or relatives.

⁴ Reasons given for which wife beating is justified include: she goes out without telling him, she neglects the house or children, she argues with him, she refuses to have sexual intercourse with him, she doesn't cook properly, he suspects she is unfaithful, and she shows disrespect for in-laws

⁵ Reasons given for refusing to have sexual intercourse with husband include: she knows her husband has a sexually transmitted disease, she knows her husband has sex with other women, and she is tired or not in the mood

() Based on 25-49 unweighted cases

Table 100 Injuries to women due to spousal violence

Percentage of ever-married women age 15-49 who have experienced spousal violence by types of injuries resulting from what their husband did to them, the type of violence, and whether they have experienced the violence ever and in the 12 months preceding the survey, Nagaland, 2015-16

Type of spousal violence experienced	Percentage of women who have had:					Number of ever-married women
	Cuts, bruises, or aches	Severe burns	Eye injuries, sprains, dislocations, or minor burns	Deep wounds, broken bones, broken teeth, or any other serious injury	Any of these injuries	
Experienced physical violence¹						
Ever ²	15.1	3.1	9.2	6.0	21.7	76
In the past 12 months	13.1	2.0	7.6	6.4	20.0	52
Experienced sexual violence						
Ever ²	15.0	0.0	4.0	9.3	22.9	46
In the past 12 months	(6.9)	(0.0)	(0.3)	(6.9)	(14.0)	31
Experienced physical or sexual violence						
Ever ²	11.9	2.4	7.2	4.7	17.1	97
In the past 12 months	9.9	1.5	5.7	4.8	15.1	70

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women.

¹ Excludes women who reported violence only in response to a direct question on violence during pregnancy

² Includes violence in the past 12 months

() Based on 25-49 unweighted cases

Table 101 Help seeking

Percentage of women age 15-49 who have ever experienced physical or sexual violence by whether they have ever sought help according to the type of violence experienced and marital status, Nagaland, 2015-16

Source	Type of violence experienced			Marital status		Total
	Physical only	Sexual only	Both physical and sexual	Ever-married	Never married	
Help seeking						
Never sought help and never told anyone	76.9	(69.1)	(70.1)	76.8	(67.7)	73.9
Never sought help but told someone	8.5	(22.7)	(13.8)	10.6	(16.2)	12.4
Sought help	14.6	(8.2)	(16.1)	12.6	(16.1)	13.7
Number of women who experienced violence	106	36	38	123	57	180

() Based on 25-49 unweighted cases

APPENDIX

ESTIMATES OF SAMPLING ERRORS

The estimates from a sample survey are affected by two types of errors: (1) non-sampling errors, and (2) sampling errors. Non-sampling errors are the results of mistakes made in implementing data collection and data processing, such as failure to locate and interview the correct household, misunderstanding of the questions on the part of either the interviewer or the respondent, and data entry errors. Although numerous efforts were made during the implementation of the fourth National Family Health Survey (NFHS-4) to minimize this type of error, non-sampling errors are impossible to avoid and difficult to evaluate statistically.

Sampling errors, on the other hand, can be evaluated statistically. The sample of respondents selected in NFHS-4 is only one of many samples that could have been selected from the same population, using the same design and expected sample size. Each of these samples would yield results that differ somewhat from the results of the actual sample selected. Sampling errors are a measure of the variability among all possible samples. Although the degree of variability is not known exactly, it can be estimated from the survey results.

A sampling error is usually measured in terms of the standard error for a particular statistic (mean, percentage, etc.), which is the square root of the variance. The standard error can be used to calculate confidence intervals within which the true value for the population can reasonably be assumed to fall. For example, for any given statistic calculated from a sample survey, the value of that statistic will fall within a range of plus or minus two times the standard error of that statistic in 95 percent of all possible samples of identical size and design.

If the sample of respondents had been selected as a simple random sample, it would have been possible to use straightforward formulas for calculating sampling errors. However, the NFHS-4 sample is the result of a multi-stage stratified design, and, consequently, it was necessary to use more complex formulae. The computer software used to calculate sampling errors for NFHS-4 is programmed in SAS. This procedure uses the Taylor linearization method for variance estimation for survey estimates that are means or proportions. The Jackknife repeated replication method is used for variance estimation of more complex statistics such as total fertility rates and child mortality rates.

The Taylor linearization method treats any proportion or mean as a ratio estimate, $r = y/x$, where y represents the total sample value for variable y , and x represents the total number of cases in the group or subgroup under consideration. The variance of r is computed using the formula given below, with the standard error being the square root of the variance:

$$SE^2(r) = var(r) = \frac{1-f}{x^2} \sum_{h=1}^H \left[\frac{m_h}{m_h-1} \left(\sum_{i=1}^{m_h} z_{hi}^2 - \frac{z_h^2}{m_h} \right) \right]$$

in which

$$z_{hi} = y_{hi} - rx_{hi}, \text{ and } z_h = y_h - rx_h$$

where h represents the stratum, which varies from 1 to H ,
 m_h is the total number of clusters selected in the h^{th} stratum,
 y_{hi} is the sum of the weighted values of variable y in the i^{th} cluster in the h^{th} stratum,
 x_{hi} is the sum of the weighted number of cases in the i^{th} cluster in the h^{th} stratum, and
 f is the overall sampling fraction, which is so small that it is ignored.

The Jackknife repeated replication method derives estimates of complex rates from each of several replications of the parent sample, and calculates standard errors for these estimates using simple formulae. Each replication considers all but one cluster in the calculation of the estimates. Pseudo-independent replications are thus created. In the NFHS-4 sample for Nagaland, there were 559 clusters. Hence, 559 replications were created. The variance of a rate r is calculated as follows:

$$SE^2(r) = var(r) = \frac{1}{k(k-1)} \sum_{i=1}^k (r_i - r)^2$$

in which

$$r_i = kr - (k-1)r_{(i)}$$

where r is the estimate computed from the full sample of 559 clusters,
 $r_{(i)}$ is the estimate computed from the reduced sample of 558 clusters (i^{th} cluster excluded), and
 k is the total number of clusters.

In addition to the standard error, the design effect (DEFT) for each estimate is also computed, which is defined as the ratio between the standard error using the given sample design and the standard error that would result if a simple random sample had been used. A DEFT value of 1.0 indicates that the sample design is as efficient as a simple random sample, while a value greater than 1.0 indicates the increase in the sampling error due to the use of a more complex and less statistically efficient design. The relative standard error (SE/R) and confidence limits (R±2SE) for each estimate are also computed.

Sampling errors for NFHS-4 are calculated for selected variables considered to be of primary interest. The results are presented in this appendix for Nagaland as a whole and for the urban and rural areas of the state. For each variable, the type of statistic (mean, proportion, rate, or ratio) and the base population are given in Table A.1. Table A.2 presents the value of the statistic (R), its standard error (SE), the number of unweighted (N) and weighted (WN) cases, the design effect (DEFT), the relative standard error (SE/R), and the 95 percent confidence limits ($R \pm 2SE$); for each variable. The DEFT is considered undefined when the standard error for a simple random sample is zero (when the estimate is close to 0 or 1).

Table A.1 List of variables for sampling errors, Nagaland, 2015-16

Variable	Estimate	Base population
HOUSEHOLDS		
Using an improved source of drinking water	Proportion	Households
Using an improved sanitation facility	Proportion	Households
Using iodized salt	Proportion	Households
Sex ratio (females per 1,000 males)	Ratio	<i>De facto</i> household population, all ages
WOMEN		
No schooling (Females age 6 years and above)	Proportion	<i>De facto</i> household population of females age 6 and above
Urban residence	Proportion	Women age 15-49
No schooling (Women age 15-49)	Proportion	Women age 15-49
Completed 10 or more years of schooling	Proportion	Women age 15-49
Never married, including married <i>gauna</i> not performed	Proportion	Women age 15-49
Currently married	Proportion	Women age 15-49
Married before age 18	Proportion	Women age 20-49
Currently using any contraceptive method	Proportion	Currently married women age 15-49
Currently using a modern contraceptive method	Proportion	Currently married women age 15-49
Currently using a traditional contraceptive method	Proportion	Currently married women age 15-49
Currently using pill	Proportion	Currently married women age 15-49
Currently using IUD/PPIUD	Proportion	Currently married women age 15-49
Currently using condom/ <i>Nirodh</i>	Proportion	Currently married women age 15-49
Currently using female sterilization	Proportion	Currently married women age 15-49
Using public health sector source of contraception	Proportion	Women age 15-49 currently using modern methods of contraception
Unmet need for family planning	Proportion	Currently married women age 15-49
Want no more children	Proportion	Currently married women age 15-49
Want to delay next birth at least 2 years	Proportion	Currently married women age 15-49
Mother received four or more antenatal care (ANC) visits	Proportion	Women with at least one birth in last five years (last birth)
Took iron and folic acid (IFA) for 100 days or more	Proportion	Women with at least one birth in last five years (last birth)
Birth registration	Proportion	<i>De jure</i> children under age 5 years
Births delivered by a health personnel	Proportion	Births in last 5 years
Institutional delivery	Proportion	Births in last 5 years
Postnatal check for mother within 2 days of birth	Proportion	Women with at least one birth in last five years (last birth)
Postnatal check for newborn within 2 days of birth	Proportion	Women with at least one birth in last five years (last birth)
Exclusive breastfeeding	Proportion	Children under age 6 months
Children with diarrhoea	Proportion	Children under age 5 years
Treated with oral rehydration salt (ORS) packets	Proportion	Children under age 5 years with diarrhoea in last 2 weeks
Children with diarrhoea taken to a health provider	Proportion	Children under age 5 years with diarrhoea in last 2 weeks
Child received BCG vaccination	Proportion	Children age 12-23 months
Child received DPT vaccination (3 doses)	Proportion	Children age 12-23 months
Child received polio vaccination (3 doses)	Proportion	Children age 12-23 months
Child received measles vaccination	Proportion	Children age 12-23 months
Child received hepatitis B vaccination (3 doses)	Proportion	Children age 12-23 months
Child with all basic vaccinations	Proportion	Children age 12-23 months
Children given vitamin A supplement in past 6 months	Proportion	Children age 9-59 months
Height-for-age, stunting (below -2SD)	Proportion	Children under age 5 years who were measured
Weight-for-height, wasting (below -2SD)	Proportion	Children under age 5 years who were measured
Weight-for-age, underweight (below -2SD)	Proportion	Children under age 5 years who were measured
Children with any anaemia	Proportion	Children age 6-59 months with an anaemia test
Women with any anaemia	Proportion	Women age 15-49 with an anaemia test
Body mass index (BMI) <18.5 kg/m ²	Proportion	Women age 15-49 who were measured
Body mass index (BMI) ≥25.0 kg/m ²	Proportion	Women age 15-49 who were measured
Have heard of HIV/AIDS	Proportion	Women age 15-49
Have comprehensive knowledge about HIV/AIDS	Proportion	Women age 15-49
Ever experienced physical or sexual violence	Proportion	Women age 15-49
Total fertility rate (last 3 years)	Rate	Women
Neonatal mortality	Rate	Births in last 5 years
Postneonatal mortality	Rate	Births in last 5 years
Infant mortality	Rate	Births in last 5 years
Child mortality	Rate	Births in last 5 years
Under-five mortality	Rate	Births in last 5 years
MEN		
No schooling (Males age 6 years and above)	Proportion	<i>De facto</i> household population of males age 6 and above
Urban residence	Proportion	Men age 15-49
No schooling (Men age 15-49)	Proportion	Men age 15-49
Completed 10 or more years of schooling	Proportion	Men age 15-49
Never married, including married <i>gauna</i> not performed	Proportion	Men age 15-49
Currently married	Proportion	Men age 15-49
Married before age 21	Proportion	Men age 25-49
Want no more children	Proportion	Currently married men age 15-49
Want to delay next birth at least 2 years	Proportion	Currently married men age 15-49
Men with any anaemia	Proportion	Men age 15-49 with an anaemia test
Body mass index (BMI) <18.5 kg/m ²	Proportion	Men age 15-49 who were measured
Body mass index (BMI) ≥25.0 kg/m ²	Proportion	Men age 15-49 who were measured
Have heard of HIV/AIDS	Proportion	Men age 15-49
Have comprehensive knowledge about HIV/AIDS	Proportion	Men age 15-49

Table A.2 Sampling errors: Total sample, Nagaland, 2015-16

Variable	Value (R)	Standard error (SE)	Number of cases		Design effect (DEFT)	Relative standard error (SE/R)	Confidence limits	
			Unweighted (N)	Weighted (WN)			R-2SE	R+2SE
