### INTRODUCTION

The 2015-16 National Family Health Survey (NFHS-4), the fourth in the NFHS series, provides information on population, health, and nutrition for India and each state and union territory. For the first time, NFHS-4 provides district-level estimates for many important indicators. All four NFHS surveys have been conducted under the stewardship of the Ministry of Health and Family Welfare (MoHFW), Government of India. MoHFW designated the International Institute for Population Sciences (IIPS), Mumbai, as the nodal agency for the surveys. Funding for NFHS-4 was provided by the United States Agency for International Development (USAID), the United Kingdom Department for International Development (DFID), the Bill and Melinda Gates Foundation (BMGF), UNICEF, UNFPA, the MacArthur Foundation, and the Government of India. Technical assistance for NFHS-4 was provided by ICF, Maryland, USA. Assistance for the HIV component of the survey was provided by the National AIDS Control Organization (NACO) and the National AIDS Research Institute (NARI), Pune.

Four survey questionnaires – household, woman's, man's, and biomarker-were used to collect information in 19 languages using Computer Assisted Personal Interviewing (CAPI). All women age 15-49 and men age 15-54 in the selected sample households were eligible for interviewing. In the household questionnaire, basic information was collected on all usual members of the household and visitors who stayed in the household the previous night, as well as socioeconomic characteristics of the household, water and sanitation, health insurance, and number of deaths in the household in the three years preceding the survey. Two versions of the woman's questionnaire were used in NFHS-4. The first version (district module), which collected information on women's characteristics, marriage, fertility, contraception, reproductive health, children's immunizations, and treatment of childhood illnesses, was fielded in the entire sample of NFHS-4 households. Information on these topics is available at the district, state, and national levels. In the second version of the questionnaire (state module), four additional topics, namely, sexual behaviour, HIV/AIDS, husband's background and women's work, and domestic violence, were also included. This version was fielded in a subsample of NFHS-4 households designed to provide information only at the state and national levels. The man's questionnaire covered the man's characteristics, marriage, number of children, contraception, fertility preferences, nutrition, sexual behaviour, attitudes towards gender roles, HIV/AIDS, and lifestyle. The biomarker questionnaire covered measurements of height, weight, and haemoglobin levels for children; height, weight, haemoglobin, blood pressure, and random blood glucose for women age 15-49 years and men age 15-54 years, and the collection of finger-stick blood for HIV testing in a laboratory. Questionnaire information and biomarkers were collected only with informed consent from the respondents.

The NFHS-4 sample was designed to provide estimates of all key indicators at the national and state levels, as well as estimates for most key indicators at the district level (for all 640 districts in India, as of the 2011 Census). The total sample size of approximately 572,000 households for India was based on the size needed to produce reliable indicator estimates for each district and for urban and rural areas in districts in which the urban population accounted for 30-70 percent

of the total district population. The rural sample was selected through a two-stage sample design with villages as the Primary Sampling Units (PSUs) at the first stage (selected with probability proportional to size), followed by a random selection of 22 households in each PSU at the second stage. In urban areas, there was also a two-stage sample design with Census Enumeration Blocks (CEB) selected at the first stage and a random selection of 22 households in each CEB at the second stage. At the second stage in both urban and rural areas, households were selected after conducting a complete mapping and household listing operation in the selected first-stage units.

The figures of NFHS-4 and earlier rounds may not be strictly comparable due to differences in sample size, and NFHS-4 will be a benchmark for future surveys. NFHS-4 fieldwork for Sikkim was conducted in all 4 districts of the state from 30 January to 17 July, 2015 by Development & Research Services Pvt. Limited (DRS), and collected information from 4,662 households, 5,293 women age 15-49 (including 931 women interviewed in PSUs in the state module), and 879 men age 15-54. Survey response rates were almost 100 percent for households, 98 percent for women, and 97 percent for men.

This report presents the key findings of the NFHS-4 survey in Sikkim, followed by detailed tables and an appendix on sampling errors. At the time of finalization of this report, wealth quintiles for the country as a whole were not ready. Therefore, on finalization of the national report, the breakup of key indicators by wealth quintiles for all states will be provided as an additional document and uploaded on the official website of MoHFW and IIPS.

### HOUSEHOLD CHARACTERISTICS

#### Household composition

In Sikkim 33 percent of households are in urban areas. On average, households are comprised of 4 members. Fourteen percent of households are headed by women, with 12 percent of the population living in female-headed households.

The majority of households in Sikkim have household heads who are Hindu (59%). Thirty-one percent of households have household heads who are Buddhist/Neo-Buddhist, 9 percent who are Christian, and 2 percent are headed by those of other religions.

More than one-third (37%) of households in Sikkim have household heads who belong to a scheduled tribe, 32 percent belong to other backward classes, and 6 percent belong to a scheduled caste. Twenty-five percent of Sikkim's household heads do not belong to scheduled castes, scheduled tribes, or other backward classes.

A little over one-fifth (23%) of Sikkim's population is under age 15; 6 percent are age 65 and over. The overall sex ratio of the population is 942 females per 1,000 males, and the sex ratio of the population under seven years of age is 907 females per 1,000 males. An overwhelming majority of persons have an *Aadhaar* card (91%).

Among children below 18 years of age, 7 percent have experienced the death of one or both parents. In all, 80 percent of children below 18 years of age live with both parents, 11 percent live with one parent (mostly with their mother), and the remaining 9 percent live with neither parent. Births of almost all (99%) children under five years of age were registered with the civil authorities, and 92 percent of children have a birth certificate.

#### **Housing characteristics**

Nearly three-fourths (72%) of households in Sikkim live in a *pucca* house, while almost all households (99%) have electricity. Only 1 percent of households use unimproved sanitation facilities and 0.3 percent do not have any facility, which means that household members practice open defecation, a substantial improvement from 11 percent at the time of NFHS-3.

Ninety-two percent of households in Sikkim have water piped into their dwelling, yard, or plot.

Most of the households use an improved source of drinking water, and 92 percent have water piped into their dwelling, yard, or plot. Urban households (97%) are more likely than rural households (90%) to have water piped into their dwelling, yard, or plot. Nearly all households (98%) use an appropriate method to treat their drinking water to make it potable (mostly by

boiling). Nearly three-fifths (59%) of the households in Sikkim use clean fuel for cooking (mainly LPG/natural gas), and 39 percent of households use solid fuel, more so in the rural areas (57%).

#### Selected household possessions

Almost all urban households (98%) and rural households (94%) in Sikkim have a mobile phone. Ninety-one percent of households have a bank or post office account. BPL cards are held by one-third of households, down from 45 percent in NFHS-3. Sixty-eight percent own a house, but the proportion is much lower in urban areas (47%). Agricultural land is owned by 65 percent of rural households and 18 percent of urban households. Overall, 50 percent of all households in Sikkim own agricultural land. More than half (56%) of households own farm animals, including some urban households (7%).

### **EDUCATION**

#### School attendance among children

Nearly all children age 6-17 years both in urban and rural areas (95-96%) in Sikkim attend school. School attendance is almost universal (98%) at age 6-14 years, and then drops to 91 percent at ages 15-17. There is no gender disparity in school attendance in any age group; even at age 16-17 years, 85 percent of boys compared with 84 percent of girls are attending school.

Are there gender differentials in children's school attendance?

Percentage of children attending school by age

#### Literacy, educational attainment, and media exposure

In NFHS-4, literate persons are those who have either completed at least standard six or passed a simple literacy test conducted as part of the survey. According to this measure, 87 percent of women age 15-49 and 92 percent of men age 15-49 are literate.

Twelve percent of women age 15-49 have never been to school, compared with only 6 percent of men. Only 24 percent of women age 15-49 in Sikkim have completed 12 or more years of schooling, compared with 29 percent of men.

Only 24 percent of women age 15-49 in Sikkim have completed 12 or more years of schooling, compared with 29 percent of men.

Media exposure is high among women and men in Sikkim. More than 9 in 10 women and almost 9 in 10 men watch television at least once a week. Men (39%) are much more likely than women (26%) to read a newspaper or magazine at least once a week. However, 6 percent of women and 10 percent of men are not regularly exposed to any form of media.

### FERTILITY

#### Age at first marriage

The median age at first marriage is 21.1 years among women age 25-49 years. Fifteen percent of women age 20-24 years got married before the legal minimum age of 18, down from 30 percent in NFHS-3. Eleven percent of men age 25-29 years got married before the legal minimum age of 21, down from 24 percent of men in NFHS-3.

#### **Fertility levels**

The total fertility rate (TFR) in Sikkim is 1.2 children per woman, nearly one child below replacement level fertility. Fertility decreased by more than one child (1.6) in the 13 years between NFHS-2 and NFHS-4.

Fertility, at 1.1 children per woman in urban areas and at 1.2 children in rural areas, is well below replacement level. Among births in the three years preceding the survey, 5 percent were of birth order four or higher, compared with 17 percent in NFHS-3.

Despite very low fertility, the greatest differentials in fertility are reflected by religion, caste/tribe, residence, and schooling. At current fertility rates, women with no schooling will have 0.7 children more than women who have had 12 or more years of schooling (a TFR of 1.7,

compared with 1.0). Christian women are likely to have more children than Hindu or Buddhist/Neo-Buddhist women (a TFR of 1.3). The total wanted fertility of women in Sikkim is about one child (0.9).

#### **Pregnancy outcome**

Ninety-three percent of last pregnancies in the five years preceding the survey ended in a live birth, and the remaining 7 percent terminated in foetal wastage (miscarriage, abortion, and stillbirth). Miscarriage is the most commonly reported type of foetal wastage, accounting for 5 percent of all pregnancies, and abortions and stillbirths accounted for 1 percent each.

#### **Teenage pregnancy**

Among young women age 15-19 in Sikkim, only 3 percent have already begun childbearing, that is, they have already had a live birth or are pregnant with their first child, down from 12 percent in NFHS-3. One percent of women age 16 years have started childbearing, but this proportion increases to 3 percent among women age 18 years and to 7 percent among women age 19 years. Young women with only 5-9 years of schooling are more likely to have begun childbearing than young women with 12 or more years of schooling.

#### **Birth intervals**

The median interval between births in the five years before the survey in Sikkim is 58.5 months, 24 months longer than in NFHS-3. Five percent of births take place within 18 months of the last birth and 12 percent occur within 24 months. Only 26 percent of births occur within three years of the previous birth (down from 53% in NFHS-3), and nearly half (48%) of births occur 60 months or longer after the preceding birth. Research shows that waiting at least three years between children reduces the risk of infant mortality.

Only 26 percent of births in Sikkim occur within three years of the previous birth, and almost half (48%) of births occur 60 or more months after the previous birth.

6

#### **Fertility preferences**

Nearly two-thirds (66%) of currently married women and nearly three-fifths (59%) of currently married men want no more children, are already sterilized, or have a spouse who is sterilized. Among those who want another child, more than one-quarter of currently married women and men would like to wait at least two years before the next birth. Ninety-five percent of women and 91 percent of men consider the ideal family size to be two or fewer children.

In Sikkim, there is a slight preference for sons. Seven percent of women and 8 percent of men want more sons than daughters, whereas 4 percent of women and men want more daughters than sons. However, about two-thirds of women (67%) and 70 percent of men would like to have at least one daughter.

Women's desire for more children is affected somewhat by their current number of sons. For example, among women with two children, 87 percent with two sons and 90 percent with one son want no more children, compared with only 76 percent with two daughters who want no more children. Notably, the proportion of currently married women with two children who want no more children irrespective of their number of sons has shown a decline of 9 percentage points in the 10 years since NFHS-3.

In Sikkim, despite very low fertility, unplanned pregnancies are relatively common. If all women were to have only the number of children they wanted, the total fertility rate would have been 0.9 children per woman, considerably lower than the current level of 1.2 children per woman.

### FAMILY PLANNING

#### Contraceptive knowledge and use

Knowledge of contraception among women is almost universal (98%) in Sikkim. However, some methods are still less well known. Less than one-fifth (17%) of currently married women know about female condoms and only 7 percent have heard of the lactational amenorrhoea method (LAM). Among all women, 45 percent know about emergency contraception.

The contraceptive prevalence rate (CPR) among currently married women age 15-49 is 47 percent, a decrease of 11 percentage points since NFHS-3. Modern method use is 46 percent, indicating a decrease of 3 percentage points from its level in NFHS-3 (49%). Notably, the share of female sterilization in overall contraceptive use (38%) has remained more or less unchanged, at 37-42 percent, in Sikkim in all three NFHS surveys. Contraceptive use in NFHS-4 increases with age from 30 percent for women age 20-24 to 52 percent for women age 30-49.

In Sikkim, contraceptive use is lower in urban areas (37%) than in rural areas (51%). Contraceptive prevalence is highest among women with only less than 5 years of schooling (59%) and lowest among those with 12 or more years of schooling (30%). Moreover, currently married women with no schooling are more likely to use female sterilization (26%), compared with 9 percent of women with 12 or more years of schooling. Differences in contraceptive use by religion are not large: Buddhist/Neo-Buddhist women (49%) are only slightly more likely to use contraception than Christian and Hindu women (46%).

What contraceptive methods do women use? Currently married women

In Sikkim, contraceptive use increases with the number of children a woman has, from only 11 percent of married women with no children to 61 percent among those with four or more children. Women are more likely to use contraception if they already have a son. For example, among women with 3 children, 62 percent with at least one son use a method of family planning, compared with 47 percent of women with no sons.

The most common modern spacing method used by currently married women in Sikkim is pills (12%), followed by IUD/PPIUD (6%) and condom/*Nirodh* (5%). In general, rural women are more likely than urban women to use spacing methods.

Among the districts, current use of any contraceptive method is the highest in West District (66%), followed by South District (59%) and North District (50%); it is lowest in East District (32%). In all districts except East District, the vast majority of women who use contraception use modern methods, especially modern spacing methods, followed by female sterilization. Use of female sterilization is most common in South (24%) and West (22%) districts.

Ninety-three percent of sterilized women had their sterilization operation in the public sector, mainly in a government or municipal hospital (82%), and 86 percent of IUD or PPIUD users had their IUD insertion in the public sector.

The majority of pill (54%) users also get their supply from the public sector. Nonetheless, 46 percent of pill users and a majority of users of injectables and condoms/*Nirodhs* get their supply from the private sector or other source, including shops.

Twenty-two percent of users of modern spacing methods discontinued use within the first year after they adopted the method.

The 12-month discontinuation rate for all methods is 19 percent. Twenty-two percent of users of modern spacing methods discontinued use within the first year after they adopted the method. The most common reason for discontinuation is side effects/health concerns, followed by the desire to become pregnant.

#### **Informed choice**

Women who know about all available contraceptive methods and their side effects can make better choices about what method to use. Seventy percent of users of selected modern contraceptive methods were ever told by a health or family planning worker about other methods they could use. Only 58 percent were told about the possible side effects or problems with their method, and even fewer (42%) were told what to do if they experienced any side effects.

Seven in 10 users of selected modern contraceptive methods were ever told by a health or family planning worker about other methods they could use.

Men's attitudes

More than one-third (35%) of men age 15-49 in Sikkim agree that contraception is women's business and a man should not have to worry about it. However, only 16 percent of men think that women using contraception may become promiscuous. Only 39 percent of men know that a condom, if used correctly, protects against pregnancy most of the time.

#### **Unmet need**

Unmet need for family planning is defined as the percentage of currently married women who either want to space their next birth or stop childbearing entirely, but are not using contraception. According to this definition, 22 percent of currently married women have an unmet need for family planning, about the same as in NFHS-3. Currently, 68 percent of the demand for family planning is being satisfied and 67 percent of the demand is being satisfied by modern methods. The percentage of demand for family planning that is satisfied has decreased by 6 percentage points in the 10-year period since NFHS-3 (from 74% to 68%).

### INFANT AND CHILD MORTALITY

The infant mortality rate in Sikkim in NFHS-4 is estimated at 30 deaths before the age of one year per 1,000 live births, down from the NFHS-3 estimate of 34 and the NFHS-2 estimate of 44.

### **MATERNAL HEALTH**

#### Antenatal care

Among mothers who gave birth in the five years preceding the survey, 94 percent received antenatal care (ANC) for their last birth from a health professional (71% from a doctor and 23% from an auxiliary nurse midwife (ANM), lady health visitor (LHV), nurse, or midwife). Five percent did not receive any antenatal care. Among mothers who gave birth in the five years preceding the survey, almost all (99%) registered the pregnancy for the most recent live birth. Among the registered pregnancies, almost all (99%) received a Mother and Child Protection Card (MCP Card).

**Four or More Antenatal Care Visits by District** *Percentage of last births in the past five years* 

About three-fourths (76%) of women received antenatal care during the first trimester of pregnancy, as is recommended. Three-fourths of mothers had four or more antenatal care visits for their last birth. There are only small differences among mothers in the percentage receiving four or more antenatal visits by background characteristics. The proportion of women who received four or more antenatal care visits and the proportion of women who had their first antenatal care visit in the first trimester of pregnancy for their last birth have both increased substantially in the 10 years since NFHS-3. For 97 percent of their last births, mothers received iron and folic acid (IFA) supplements, but only 53 percent consumed them for the recommended 100 days or more. More than 97 percent of last births were protected against neonatal tetanus through tetanus toxoid vaccinations given to the mother. Nine percent of mothers took an intestinal parasite drug during pregnancy.

Three-fourths of mothers in Sikkim received at least four antenatal care visits for their last birth.

Among women with a live birth in the five years preceding the survey who met with a community health worker in the last three months of pregnancy for their most recent live birth, at least 94 percent received advice on each of five different areas (94% were advised about family planning and the importance of institutional delivery, 96% on cord care, 97% on keeping the baby warm, and 98% on breastfeeding).

When women receive antenatal care, they should receive all the services needed to monitor their pregnancy. In Sikkim, among women who received antenatal care for their last birth,

almost all received each of the services needed to monitor their pregnancy: having their weight taken (100%), having their blood pressure measured (99%), having urine and blood samples taken (99% each), and having their abdomen examined (96%).

An ultrasound test was performed during 88 percent of pregnancies in the five years preceding the survey. Women with at least 12 years of schooling were more likely to have an ultrasound test than women with no schooling. Ninety-five percent of women with at least 12 years of schooling had an ultrasound test, compared with 82 percent of women with no schooling.

#### **Delivery care**

Ninety-five percent of births take place in a health facility (mostly a government facility) and only five percent take place at home. The percentage of births in a health facility doubled in the 10 years between NFHS-3 and NFHS-4, from 47 percent in NFHS-3 to 95 percent in NFHS-4. Institutional births are more common among women who have received an antenatal check, women with more schooling, and women who are having their first, second, or third birth.

Ninety-seven percent of births during the past five years took place with assistance from a skilled provider, and 3 percent were assisted by friends and relatives, traditional birth attendants, others, or no one.

Twenty-one percent of births during the past five years were delivered by caesarean section. More than one-fourth of caesarean sections (6% of all births) were emergency caesarean sections.

Among women who had a live birth in the five years preceding the survey that was delivered in a health facility, 29 percent received financial assistance under the *Janani Suraksha Yojana* (JSY). Rural women were more likely than urban women to receive financial assistance under JSY. Women having less than five years of schooling were more likely than any other women to receive financial assistance under JSY.

Institutional Delivery by District

Percentage of births in the past five years

#### **Postnatal care**

Early postnatal care for a mother helps safeguard her health and can reduce maternal mortality. In Sikkim, 81 percent of mothers had a postnatal check after their last birth and 75 percent of mothers had a postnatal check within two days of the birth, as is recommended. Postnatal care is most common following births in a health facility; 82 percent of births in public health facilities and 94 percent of births in private health facilities were followed by a postnatal check for the mother.

Only 15 percent of last births in the five years preceding the survey received a health check in the first two days after birth. Differences by background characteristics in postnatal care for newborns are minimal.

#### Male involvement in maternal care

Ninety-six percent of men with a child under three years of age said that the youngest child's mother received antenatal care and 89 percent said they were present during at least one antenatal check received by the child's mother. However, only 71 percent of men were told by a health provider or health worker what to do if the mother had a pregnancy complication. Only 72-79 percent of men were told about the signs of specific pregnancy complications (convulsions, vaginal bleeding, prolonged labour, high blood pressure, and severe abdominal pain).

Eighty-one to 93 percent of fathers with a child less than three years of age were given information about various aspects of maternal care. Ninety-three percent were told about the importance of proper nutrition for the mother during pregnancy and 90 percent were told about the importance of delivering the baby in a health facility. Eighty-one percent were told about family planning or delaying the next child by a health provider or a health worker.

### CHILD HEALTH

#### Vaccination of children

More than four-fifths (83%) of children age 12-23 months received all basic vaccinations against six major childhood illnesses (tuberculosis, diphtheria, pertussis, tetanus, polio, and measles) at any time before the survey. Almost all children are at least partially vaccinated; only 1 percent have not received any vaccinations at all.

More than four-fifths (83%) of children have received all basic vaccinations in Sikkim.

Ninety-nine percent of children have received a BCG vaccination. However, only about nine in 10 children have received other basic vaccinations (88% have received at least the recommended three doses of polio vaccine, 93% have received the three recommended doses of DPT vaccine, and 93% have been vaccinated against measles). There is considerable dropout between the first and third doses of polio vaccine (from 99% to 88%) and DPT vaccine (from 99% to 93%).

**Trends in Vaccination Coverage** *Percentage of children 12-23 months receiving vaccinations*  Between NFHS-3 and NFHS-4, there was a large increase in vaccination coverage for three doses of DPT (from 84% to 93%) and measles (83% to 93%), and a slight increase for BCG (from 96% to 99%) and three doses of polio (from 86% to 88%). Overall, there was a substantial increase in the coverage of all basic vaccinations (from 70% to 83%). In addition, 95 percent of children received at least one dose of hepatitis B vaccine, but just over four-fifths of children (84%) received all three recommended doses of hepatitis B vaccine.

Percentage of children 12-23 months

#### **Childhood illnesses**

In the two weeks before the survey, less than one percent of children under age five years had symptoms of an acute respiratory infection (cough accompanied by (1) short, rapid breathing that is chest-related and/or (2) difficult breathing that is chest related).

Four percent of children under age five were reported to have had fever in the two weeks preceding the survey.

Overall, two percent of children under age five years had diarrhoea in the two weeks preceding the survey. Ninety-seven percent of mothers of young children have heard of oral rehydration salt (ORS) packets for the treatment of diarrhoea.

#### Integrated Child Development Services (ICDS)

The ICDS programme provides nutrition and health services for children under age six years and pregnant or breastfeeding women, as well as preschool activities for children age 3-5 years. These services are provided through community-based *anganwadi* centres.

Half of children under 6 years receive services of some kind from an *anganwadi* centre. The most common services that age-eligible children receive are supplementary food (49%), weight monitoring (45% of children 0-59 months), health check-ups (43%), and early childhood care or preschool (43% of children age 3-6 years). The service that is least likely to be accessed is immunizations (33%). More than three-fourths of the mothers of children who were weighed at an *anganwadi* centre (77%) received counselling from an *anganwadi* worker or an ANM. Among children under 6 years, almost half of their mothers (49%) received any service from an *anganwadi* centre during pregnancy, and less than half of their mothers (46%) received any service while breastfeeding.

# How many children received *anganwadi* centre services?

Percentage of age-eligible children receiving services

### **BREASTFEEDING, NUTRITION, AND ANAEMIA**

#### Infant feeding

Although breastfeeding is nearly universal in Sikkim, only 55 percent of children under 6 months are exclusively breastfed, as the World Health Organization (WHO) recommends. Ninety-five percent are put to the breast within the first day of life, but only 70 percent started breastfeeding in the first hour of life (as recommended). While the initiation of breastfeeding indicators show substantial improvement since NFHS-3, some infants are still deprived of the highly nutritious first milk (colostrum) and the antibodies it contains.

It is recommended that nothing be given to children other than breastmilk even in the first three days when the milk has not begun to flow regularly, because prelacteal feeds limit the frequency of suckling by the infant and expose the baby to the risk of infection. Five percent of children in Sikkim are given something other than breastmilk during the first three days. Overall, 93 percent of children continue breastfeeding at 1 year and 98 percent continue breastfeeding at 2 years. The median duration of breastfeeding is 32 months, which is the age to which half of children are breastfeed.

After the first 6 months, breastmilk is no longer enough to meet the nutritional needs of infants. Therefore, complementary foods should be added to the diet of the child. However, at age 6-8 months less than two-thirds of children in Sikkim receive breastmilk and complementary foods.

WHO has several recommendations for infant and young child feeding (IYCF) practices for children age 6-23 months. The key IYCF indicators measure the adequacy of dietary diversity and meal frequency for breastfed and nonbreastfed children. Only four in 10 children age 6-23 months (42%) are fed the recommended minimum number of times per day, while almost half (49%) are fed from the appropriate number of food groups. Only 23 percent are fed according to all three recommended practices.

Micronutrient deficiency is a major contributor to childhood morbidity and mortality. Vitamin A is an essential nutrient for the immune system. Severe vitamin A deficiency (VAD) can cause eye damage and a higher risk of dying from measles and diarrhoeal disease. The Government of India recommends that children under 5 years of age receive vitamin A supplements every six months, starting at age 9 months. In Sikkim, more than four-fifths of children age 9-59 months were given a vitamin A supplement in the past six months and 77 percent of children age 9-23 months ate vitamin A-rich foods during the day or night before the survey.

Iron deficiency is a primary cause of anaemia. Eating foods rich in iron and taking iron supplements can help prevent anaemia. Only 43 percent of children age 9-23 months ate iron-rich foods during the day or night before the survey, but half of children age 6-59 months (51%) were given iron supplements in the week before the survey.

#### Children's nutritional status

Thirty percent of children under age five years are stunted, or too short for their age, which indicates that they have been undernourished for some time. Fourteen percent are wasted, or too thin for their height, which may result from inadequate recent food intake or a recent illness causing weight loss, and 6 percent are severely wasted. Fourteen percent are underweight, which takes into account both chronic and acute undernutrition. Nine percent of children are overweight. Even during the first six months of life, when almost all babies are breastfed, 17 percent of children are stunted, 6 percent are underweight, and 20 percent are wasted.

Note: Nutritional status estimates are based on the 2006 WHO International Reference Population

Children's nutritional status in Sikkim has improved since NFHS-3 by some measures, but not by all measures. Stunting decreased from 38 percent to 30 percent in the 10 years between NFHS-3 and NFHS-4, and the percentage of children who are underweight dropped from 20 percent to 14 percent. However, in the same period, wasting increased from 10 percent to 14 percent. Despite the improvements in stunting and underweight, child malnutrition is still a major problem in Sikkim.

The level of undernutrition is slightly higher among boys than girls and among rural children than urban children. While stunting and underweight generally decrease as the mother's schooling increases, wasting shows an inconsistent pattern with mother's schooling. Stunting and underweight tend to increase with the age of the child.

#### Adults' nutritional status

One-third of women and 37 percent of men are either too thin or overweight or obese. More men and women are overweight or obese than thin. Six percent of women and 2 percent of men in Sikkim are too thin, and 27 percent of women and 35 percent of men are overweight or obese. About two-thirds of women and men are at a healthy weight for their height.

Undernutrition is particularly common in the younger age groups and among those who have never married. Overweight and obesity are most prevalent in older adults, those in urban areas, and less-educated women.

The use of iodized salt prevents iodine deficiency, which can lead to miscarriage, goitre, and mental retardation. Nearly all of Sikkim's households were using iodized salt at the time of the survey.

#### Anaemia

Anaemia is a condition that is marked by low levels of haemoglobin in the blood. Iron deficiency is estimated to be responsible for about half of all anaemia globally, but anaemia can also be caused by malaria, hookworm and other helminths, other nutritional deficiencies, chronic infections, and genetic conditions. Anaemia can result in maternal mortality, weakness, diminished physical and mental capacity, increased morbidity from infectious diseases, perinatal mortality, premature delivery, low birth weight, and (in children) impaired cognitive performance, motor development, and scholastic achievement. Anaemia is a major health problem in Sikkim, especially among women and children.

Among children between the ages of 6 and 59 months, more than half (55%) are anaemic. This includes 32 percent who are mildly anaemic, 22 percent who are moderately anaemic, and less than 1 percent who suffer from severe anaemia. Girls are slightly less likely than boys to have anaemia. Anaemia tends to decrease as children get older. Children of mothers who have anaemia are much more likely to be anaemic. Although anaemia levels vary somewhat according to background characteristics, anaemia among children is widespread in every group. For example, 44 percent of children are anaemic even if their mother has 12 or more years of schooling.

Thirty-five percent of women in Sikkim have anaemia, including 27 percent with mild anaemia, 7 percent with moderate anaemia, and 1 percent with severe anaemia. Anaemia is particularly high among the youngest women (49%), those who have never married (43%), and those who are breastfeeding (38%). Sixteen percent of men are anaemic. The prevalence of anaemia among both women and men has declined precipitously over the past decade.

### ADULT HEALTH AND HEALTH CARE

#### Tuberculosis

In Sikkim, 475 persons per 100,000 are estimated to have medically treated tuberculosis, based on reports from household respondents. The prevalence of medically treated tuberculosis is higher among men (506) than among women (443) and is higher in urban areas (522) than in rural areas (455).

Most respondents have heard of tuberculosis (95% of women and 93% of men). Among those who have heard of tuberculosis, 89 percent of women and 88 percent of men know that it is spread through the air by coughing or sneezing. About half (46%) of women and three-quarters (76%) of men have misconceptions about how tuberculosis is spread. Overall, 97 percent of women and 96 percent of men know that tuberculosis can be cured, and only 4 percent of women and 9 percent of men say that if a family member had tuberculosis, they would want to keep it a secret.

#### Diabetes, asthma, goitre, heart disease, and cancer

According to self-reports, 1,580 women age 15-49 and 1,249 men age 15-49 per 100,000 have diabetes. Overall, 1,025 women and 928 men per 100,000 suffer from asthma. The prevalence of diabetes and asthma among women is higher among older age groups, those who have less schooling, and those living in urban areas. Goitre or any other thyroid disorder is about equally as common as asthma among women (1,040 per 100,000 women), but goitre is much less common than asthma among men age 15-49 (267 per 100,000 men). The prevalence of any heart disease is much higher among women (640 per 100,000) than among men (36 per 100,000). Among the five diseases, cancer is the least common, with 30 women per 100,000 and no men reportedly suffering from cancer.

#### **Blood pressure (hypertension)**

Eighteen percent of women age 15-49 in Sikkim have hypertension, including 12 percent with Stage 1 hypertension, 3 percent with Stage 2 hypertension, and 2 percent with Stage 3 hypertension. Thirty-eight percent of women have normal blood pressure, including 1 percent of women with normal blood pressure who are taking medicine to lower their blood pressure. The prevalence of hypertension among men age 15-49 is substantially higher than among women. Thirty-one percent of men in Sikkim have hypertension, including 20 percent with Stage 1 hypertension, 5 percent with Stage 2 hypertension, and 3 percent with Stage 3 hypertension. A little less than one-fifth (19%) of men have normal blood pressure, including 1 percent of men with normal blood pressure who are taking medicine to lower their blood pressure. For both women and men, hypertension tends to increase with age.

#### **Blood glucose**

NFHS-4 included measurement of random blood glucose among women age 15-49 and men age 15-54. Four percent of women age 15-49 in Sikkim have high blood glucose levels, and an

additional 3 percent have very high blood glucose levels. In comparison, 5 percent and 4 percent of men age 15-49 have high and very high blood glucose levels, respectively. Older women and men, those living in urban areas, and women with little or no schooling have relatively high blood glucose levels.

#### **Health examinations**

In Sikkim, 13 percent of women have ever undergone an examination of the cervix, 7 percent have ever undergone a breast examination, and 32 percent have ever undergone an examination of the oral cavity.

#### Tobacco and alcohol use

Over 40 percent of men, but only 7 percent of women, age 15-49 use some form of tobacco. Men are much more likely to smoke cigarettes (28%) or use *khaini* (15%) than to use other types of tobacco. Among men, the use of any form of tobacco is almost the same in rural and urban areas. Most men who smoke cigarettes or *bidis* smoked 10 or more cigarettes or *bidis* in the past 24 hours. Men are more likely to drink alcohol (51%) than to use tobacco, and almost one-fourth of women say that they drink alcohol. Among men and women who drink alcohol, three-fifths of men and about two-fifths of women drink alcohol at least once a week.

#### Source of health care

The public health sector is the main source of health care for nine in 10 households, with government/municipal hospitals (69%) being the primary source. Urban households are somewhat less dependent on the public health sector than rural households; 18 percent of urban households primarily use private sector sources of health care, compared with only 6 percent of rural households.

#### **Health insurance**

Despite the emergence of a number of health insurance programmes and health schemes, only 30 percent of households in Sikkim have any kind of health insurance that covers at least one member of the household. Health insurance coverage is only slightly more common in urban areas (33%) than in rural areas (29%). In Sikkim, five types of programmes dominate: the State health insurance scheme, medical reimbursement from employers, the Employee's State Insurance Scheme (ESIS), a variety of privately purchased commercial health insurance plans, and the Central Government Health Scheme (CGHS).

Only 23 percent of women and 20 percent of men age 15-49 years in Sikkim are covered by any health scheme or health insurance. More men residing in rural areas than in urban areas are covered by any health scheme or health insurance, but there is no such differential among women. Health scheme or health insurance coverage is higher among women and men with 12 or more years of schooling than among those with less schooling or no schooling.

### HIV/AIDS

#### Awareness of HIV or AIDS

Ninety-one percent of women in Sikkim have heard of HIV or AIDS. In urban areas, 94 percent know about HIV or AIDS, compared with 89 percent in rural areas. Young women age 15-24 years are more likely (97%) than older women age 40-49 (80%) to have heard of HIV or AIDS. Women having no schooling (62%) and those not having regular media exposure (73%) are less likely than other women to have heard of HIV or AIDS.

Men are more likely than women to know about HIV or AIDS. Almost all men (96%) in Sikkim have heard of HIV or AIDS, including 98 percent in urban areas.

#### Knowledge of prevention and transmission

Men are much more likely than women to know how HIV is transmitted and how to keep from getting it. For example, only 63 percent of women know that consistent condom use can help prevent HIV/AIDS, compared with 73 percent of men, and seven-tenths (71%) of women know that having just one uninfected partner who has no other partners can reduce the chance of getting HIV/AIDS, compared with 78 percent of men.

**Do people know how to prevent HIV/AIDS?** Percentage of women and men age 15-49

Only 26 percent of women and 36 percent of men in Sikkim have a 'comprehensive knowledge' about HIV/AIDS. This means they know that consistent use of condoms every time they have sex and having just one uninfected sex partner who has no other partners can reduce the chance of getting HIV/AIDS, they know that a healthy-looking person can have HIV/AIDS, and they reject two common misconceptions about transmission or prevention of HIV/AIDS.

#### **HIV-related stigma**

Over three-fifths (62%) of women and 49 percent of men in Sikkim would be willing to take care of a relative with HIV/AIDS in their home. Almost the same proportion of women (87%) and men (90%) say that a female teacher who has HIV/AIDS but is not sick should be allowed to continue teaching. Four-fifths of adults say that they would buy fresh vegetables from a shopkeeper with HIV/AIDS. Sixty-eight percent of women and 82 percent of men say that if a family member got infected with HIV/AIDS, they would not want to keep it a secret.

#### HIV testing prior to NFHS-4, blood transfusions, and safe injections

Only 20 percent of women and 14 percent of men age 15-49 had ever been tested for HIV prior to NFHS-4. There are only small differences in the proportions of urban and rural women and men who have ever been tested for HIV prior to NFHS-4. Almost two-fifths (38%) of women who had a live birth in the past five years and received ANC during pregnancy were tested for HIV during ANC.

# Almost two-fifths (38%) of women who had a live birth in the past five years and received ANC during pregnancy were tested for HIV during ANC.

In Sikkim, men (9%) are more likely than women (3%) to have ever had a blood transfusion. Men are also more likely than women to have received an injection in the past 12 months (18% of men, compared with 15% of women).

For almost nine-tenths (87%) of adults who received an injection in the past 12 months, a disposable syringe was used.

### SEXUAL BEHAVIOUR

NFHS-4 included questions on respondents' sexual behaviour. Respondents were asked about their age at first sex, their current and previous sexual partners, higher-risk intercourse and condom use. In addition, men were asked whether they had paid for sex in the past year. These questions are sensitive and subject to reporting bias, so the results should be interpreted with caution.

#### Higher-risk behaviour

Higher-risk sex is sexual intercourse with someone who is neither a spouse nor a cohabiting partner. Among those who had sex in the past 12 months, almost none of the women and 14 percent of men reported having had higher-risk sex during the past 12 months. The percentage of men who had higher-risk sexual intercourse in the past 12 months is somewhat higher in urban areas (15%) than in rural areas (13%). Even fewer respondents said that they had multiple sex partners in the past 12 months (no women and 1% of men).

Over seven-tenths (72%) of men who had higher-risk sex in the past 12 months reported using a condom the last time they had higher-risk sex. One percent of all men age 15-49 said they had paid for sex in the past year.

### WOMEN'S EMPOWERMENT

#### Women's hygiene

Using a hygienic method of menstrual protection is important for women's health and personal hygiene. In NFHS-4, young women age 15-24 were asked what method or methods they use for menstrual protection, if anything. In Sikkim, 76 percent use sanitary napkins, 52 percent use cloth, 9 percent use locally prepared napkins, and 1 percent use tampons. Overall, 85 percent of women age 15-24 use a hygienic method of menstrual protection. Women with at least 10 years of schooling are about one and half times as likely to be using a hygienic method as women with no schooling or less than five years of schooling. Rural women are less likely to use a hygienic method of menstrual protection than their urban counterparts.

#### **Employment and earnings**

Only 24 percent of all women age 15-49 were employed in the 12 months preceding the survey; in the same period, 78 percent of all men age 15-49 were employed. Among employed women, 83 percent earned cash, including 16 percent whose earnings were in both cash and kind, and 16 percent were not paid at all. Most men who were employed earned cash (96%) and only 2 percent were not paid at all. Seventy-four percent of employed women worked in a non-agricultural occupation, compared with 70 percent of employed men.

Only 24 percent of all women age 15-49 were employed in the 12 months preceding the survey.

Among currently married women who work and are paid in cash, 92 percent decide how their earnings will be used, either alone or jointly with their husbands. One in every two women who work for cash say that they earn more or about the same as their husbands. By contrast, 57 percent of currently married men whose wives have cash earnings report that they alone or jointly with their wives decide how her earnings are used and 66 percent of men who have cash earnings and whose wives have cash earnings say that their wife earns more or about the same as them.

#### **Decision making**

Currently married women were asked who makes decisions about their own health care, major household purchases, and visits to their own family or relatives. Women are almost equally likely to participate in decisions about their own health care, major household purchases, and visits to their own family and relatives (92-94%). Overall, 89 percent of currently married

women participate in making all three of these decisions, and 5 percent do not participate in making any of the three decisions. Participation in all three decisions varies most by years of schooling, increasing from 83 percent among women having no schooling to 94 percent among women completing 12 or more years of schooling.

Currently married men were also asked who makes decisions about their own health care and major household purchases. Men were somewhat more likely than women to report that they alone or jointly with their wife participate in both these decisions: 97 percent participate in making decisions about their own health care and 96 percent participate in decisions about major household purchases.

#### Other indicators of women's empowerment

Forty-nine percent of women have some money that they can decide how to use. The proportion of women with money which they control is higher among urban than rural women, increases sharply with age, and is highest among women with 12 or more years of schooling (62%) and women who are employed for cash (75%) than any other group of women.

Almost two-thirds (64%) of women have a bank or savings account that they themselves use.

Almost two-thirds (64%) of women have a bank or savings account that they themselves use. This percentage is highest, at 83 percent, among women who have 12 or more years of schooling. Women's knowledge and use of microcredit programmes is limited. Forty-two percent of women know of a microcredit programme in the area and only 5 percent have ever taken a loan from a microcredit programme.

Eighty-five percent of women in Sikkim are allowed to go by themselves to all three of the following places: the market, a health facility, and places outside the village/community. Young women age 15-19, those from rural areas, and those living in non-nuclear households are somewhat less likely to be allowed to go to all three places alone.

#### **Ownership of assets**

Twenty-four percent of women and 79 percent of men own a house alone or jointly with someone else, and 21 percent of women and 74 percent of men own land alone or jointly with someone else. Ownership of both a house and land is more common in rural than urban areas for both women and men.

Twenty-four percent of women own a house alone or jointly with someone else, and 21 percent of women own land alone or jointly with someone else.

Four-fifths of women have a mobile phone that they themselves use, and among women who have a mobile phone that they themselves use, almost nine in 10 (86%) can read SMS messages. Eighty-seven percent of urban women have a mobile phone they themselves use, compared with 75 percent of rural women. Only 54 percent of young women age 15-19 have a mobile phone they themselves use, compared with 91 percent among those age 25-29 and 89 percent among those age 30-34. However, all the young women age 15-19 having a mobile phone they themselves use are able to read SMS messages. Mobile phone ownership increases sharply with schooling of women, from only 48 percent of women who have no schooling to 99 percent of women with 12 or more years of schooling. Among women who have a mobile phone they themselves use, less than half of those with no schooling can read SMS messages, compared with 100 percent of those with at least 12 years of schooling.

*Four-fifths of women have a mobile phone that they themselves use.* 

### Gender-role attitudes

Eight percent of women believe it is justifiable for a husband to beat his wife under some circumstances. Women are most likely to believe that wife beating is justified if a woman shows disrespect for her in-laws (5%), followed by if she neglects the house or children (3%) and if he suspects her of being unfaithful (2%), if she goes out without telling him (2%), or if she argues with him (2%). Men are about equally likely to agree: 6 percent say that wife beating is justified in some circumstances, especially if the wife shows disrespect for in-laws (4%) or if she neglects the house or children, if she goes out without telling him, or if the husband suspects his wife is unfaithful (3% each). Even among women and men who have completed at least 12 years of schooling, 5 percent of women and 4 percent of men say that a husband is justified in beating his wife for one or more of the specified reasons.

Seventy-seven percent of women and 46 percent of men believe that a woman is justified in refusing to have sex with her husband if she knows he has a sexually transmitted disease, if she knows he has intercourse with other women, and if she is tired or not in the mood. Most men, 84 percent, agree that if a wife refuses to have sex with her husband he does not have a right to get angry and reprimand her, refuse to give her financial support, use force to have sex even if she doesn't want to, or have sex with another woman.

## **DOMESTIC VIOLENCE**

Among women age 15-49, 5 percent have ever experienced physical violence and 1 percent have ever experienced sexual violence. In all, 5 percent of women in Sikkim have experienced physical or sexual violence.

## One in every 20 women age 15-49 in Sikkim has experienced physical or sexual violence.

## Violence during pregnancy

Less than one percent of women who have ever been pregnant have ever experienced physical violence during one or more of their pregnancies. Women with no schooling are much more likely than women with some schooling to have experienced violence during pregnancy.

## **Spousal violence**

Two percent of ever-married women report having been slapped by their husband. About 1 percent each report pushed, shaken, or having being something thrown at them; being punched; or being kicked, dragged, or beaten up. A negligible proportion of women have experienced having their arm twisted or hair pulled, and being threatened or attacked with a knife, gun, or any other weapon. One percent of ever-married women report that their husbands have physically forced them to have sex even when they did not want to and a negligible proportion report that their husband forced them with threats or other ways to perform sexual acts

# Is alcohol use related to spousal physical or sexual violence?

Percentage of ever-married women experiencing violence

Note: Category "Husband drinks, but never gets drunk" not shown Since there are fewer than 25 unweighted cases.

they did not want to perform. Overall, 3 percent of ever-married women have experienced spousal physical or sexual violence from their current husband or, if not currently married, from their most recent husband. Three percent report spousal emotional violence. A negligible proportion of ever-married women have ever initiated violence against their husband.

Although the prevalence of spousal violence is low in Sikkim, it prevails across various socioeconomic groups and husband's characteristics. Rural women are more likely to have experienced spousal violence than urban women. Women with no schooling are more likely to have experienced spousal violence than women with any schooling.

#### Table 1 Results of the household and individual interviews

Number of households, number of interviews with women and men, and response rates, according to residence, Sikkim, 2015-16

na = Not applicable

<sup>1</sup> Nuclear households are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted, or fostered) with or without unrelated individuals.

<sup>2</sup> Protected dug well, protected spring, rainwater, community RO plant

<sup>3</sup> Surface water, unprotected dug well, unprotected spring, cart with small tank, tanker truck, bottled water

<sup>4</sup> Total may add to more than 100.0 because households may use more than one method of purification

<sup>5</sup> Appropriate water treatment methods include boiling, bleaching, filtering, and electronic purifying

<sup>6</sup> Includes ventilated improved pit (VIP)/biogas latrine and twin pit/composting toilet

<sup>7</sup> Facilities that would be considered improved if they were not shared by two or more households

<sup>8</sup> Includes dry toilet

<sup>9</sup> Houses made from mud, thatch, or other low-quality materials are called *kachha* houses, houses that use partly low-quality and partly high-quality materials are called semi-*pucca* houses, and houses made with high quality materials throughout, including the floor, roof, and exterior walls, are called *pucca* houses.

<sup>10</sup> Electricity, LPG/natural gas, or biogas

<sup>11</sup> Includes coal/lignite, charcoal, wood, straw/shrubs/grass, agricultural crop waste, and dung cakes

<sup>12</sup> Frequency of smoking by anyone inside the house

#### Table 5 Household possessions and land ownership

Percentage of urban, rural, and total households and *de jure* population possessing various household goods, means of transport, agricultural land, a house and farm animals and having a bank/post office account, health scheme/health insurance, a BPL card, and a long-lasting insecticide-treated (LLIN) mosquito net, Sikkim, 2015-16

| Household possessions   | Urban | Rural | Total | De jure<br>population |

| 45-49       | (0.000) | 0.000  | 0.000 | *       | (0.000) | (0.000) | (0.011) |
|             |         |        |       |         |         |         |         |
| TFR (15-49) | 1.11    | 1.21   | 1.17  | 1.29    | 2.22    | 2.02    | 2.75    |
| CBR         | 12.1    | 11.1   | 11.4  | 13.5    | 19.2    | 18.2    | 24.5    |

Note: Rates are for the period 1-36 months preceding the survey (approximately 1996-98 for NFHS-2, 2003-05 for NFHS-3, and 2013-15 for NFHS-4). Age-specific fertility rates are expressed per woman. Rates for the age group 45-49 might be slightly biased due to truncation.

TFR = Total fertility rate, expressed per woman CBR = Crude birth rate, expressed per 1,000 population

() Based on 125-249 unweighted woman-years of exposure
 \* Rate not shown; based on fewer than 125 unweighted woman-years of exposure

#### Table 12 Fertility by background characteristics

Total fertility rate for the three years preceding the survey, percentage of women age 15-49 currently pregnant, mean number of children ever born to women age 40-49, and total wanted fertility rate, by background characteristics, Sikkim, 2015-16

| Background characteristic | Total<br>fertility rate | Percentage of<br>women age<br>15-49<br>currently<br>pregnant | Mean number<br>of children<br>ever born<br>to women<br>age 40-49 | Total wanted<br>fertility rate |
|---------------------------|-------------------------|--|--|--------------------------------|

Note: First-order births are excluded from the table. The interval for multiple births is the number of months since the preceding pregnancy that ended in a live birth. Total includes information on births to women age 15-19 or age 40-49, women belonging to "other" religions, women who don't know their caste/tribe, and births of birth order 7 or more, which is not shown separately.

() Based on 25-49 unweighted cases

#### Table 16 Fertility preferences by number of living children

Percent distribution of currently married women and men age 15-49 by desire for children, according to number of living children, Sikkim, 2015-16

Note: All information in this table is based on women's reports. Table includes all users of modern contraceptive methods regardless of their marital status.

AYUSH = Ayurveda, yoga and naturopathy, unani, siddha and homeopathy; UHC = Urban health centre; UHP = Urban health post; UFWC = Urban family welfare centre; CHC = Community health centre; PHC = Primary health centre; ANM = Auxiliary nurse midwife; ICDS = Integrated Child Development Services; ASHA = Accredited Social Health Activist; IUD = Intrauterine device;

PPIUD = Postpartum intrauterine device

<sup>1</sup> Excludes standard days method, lactational amenorrhoea method (LAM), and "other" modern methods

() Based on 25-49 unweighted cases
 \* Percentage not shown; based on fewer than 25 unweighted cases

#### Table 26 Informed choice

Among women who are current users of selected modern contraceptive methods who started the last episode of use within the five years preceding the survey, the percentage who were informed about possible side effects or problems of that method, the percentage who were informed about what to do if they experienced side effects, and the percentage who were ever told by a health or family planning worker about other methods of family planning they could use, by method, Sikkim, 2015-16

| Method  | Percentage who<br>were informed<br>about possible side<br>effects or problems<br>of method used | Percentage who<br>were informed<br>about what to do<br>if they experienced<br>side effects | Percentage who were<br>ever told by a health or<br>family planning worker<br>of other methods that<br>could be used | Number<br>of<br>women |
|---|---|--|---|-----------------------|
| Female sterilization <sup>1</sup><br>Pill<br>IUD or PPIUD | 47.0<br>54.2<br>74.9  | 26.1<br>41.1<br>58.0   | 52.1<br>73.5<br>77.5  | 77<br>193<br>85       |
| Total   | 57.6  | 41.9   | 69.8  | 354                   |

Note: Table includes only the contraceptive methods separately shown in the table and excludes users who obtained their method from friends/relatives or husband.

IUD = Intrauterine device; PPIUD = Postpartum intrauterine device

<sup>1</sup> Among women who were sterilized in the five years preceding the survey

#### Table 27 Twelve-month contraceptive discontinuation rates

Among women age 15-49 who started an episode of contraceptive use within the five years preceding the survey, the percentage of episodes discontinued within 12 months, by reason for discontinuation and specific method, Sikkim, 2015-16

|   |                   |                                 |  | Reason for disc                     | continuation                          |   |                 |                            | _   |                                     |

| All spacing methods <sup>7</sup>        | 0.0               | 6.5                             | 2.7  | 7.7                                 | 0.8                                   | 1.7   | 2.8             | 22.2                       | 1.0   | 603                                 |
| All methods                             | 0.0               | 5.6                             | 2.3  | 6.8                                 | 0.7                                   | 1.5   | 2.4             | 19.4                       | 1.1   | 693                                 |

Note: Figures are based on life table calculations using information on episodes of contraceptive use that began 3-62 months preceding the survey. All methods include female sterilization, male sterilization, IUD or PPIUD, rhythm, and "other" methods, which are not shown separately.

<sup>1</sup> Includes infrequent sex/husband away, difficult to get pregnant/menopausal, and marital dissolution/separation

<sup>2</sup> Includes lack of access/too far, costs too much, and inconvenient to use

 $^{\scriptscriptstyle 3}$  Reasons for discontinuation are mutually exclusive and add to the total in this column

<sup>4</sup> The episodes of use included in this column are a subset of the discontinued episodes included in the discontinuation rate. A woman is considered to have switched to another method if she used a different method in the month following discontinuation or if she gave "wanted a more effective method" as the reason for discontinuation and started another method within two months of discontinuation.

<sup>5</sup> Number of episodes of use includes both episodes of use that were discontinued during the period of observation and episodes of use that were not discontinued during the period of observation

<sup>6</sup> Includes other modern spacing methods that are not shown separately

<sup>7</sup> Includes other spacing methods that are not shown separately

## Table 28 Men's contraception-related perceptions and knowledge

Percentage of men age 15-49 who agree with two specific statements about women and contraception, and percent distribution of men according to their belief about the efficacy of condoms in preventing pregnancy, by background characteristics, Sikkim, 2015-16

|                           | Percentage of me              | en who agree              |                     |               |               |                                    |       |           |

Percentage of women and men age 15-49 who were first married by specific exact ages, percentage never married, and median age at first marriage, first cohabitation with spouse, and first sexual intercourse according to current age, Sikkim, 2015-16

na = Not applicable due to censoringa = Omitted because less than 50 percent of the women or men were married, began living with their spouse, or had sexual intercourse for the first time before reaching the beginning of the age group.

## Table 34 Early childhood mortality rates

Neonatal, postneonatal, infant, child, and under-five mortality rates for five-year periods preceding the survey and 0-4 years before NFHS-3 by residence and total for 0-4 years before NFHS-2, Sikkim, 2015-16

| Years preceding the survey | Neonatal<br>mortality<br>(NN) | Postneonatal<br>mortality <sup>1</sup><br>(PNN) | Infant<br>mortality<br>(1q0) | Child<br>mortality<br>( <sub>4</sub> q <sub>1</sub> ) | Under-five<br>mortality<br>$(_5q_0)$ |

| In any avoidable high-risk category                         | 16.5                        | 0.9           | 45.5                                    |
| Total   | 100.0                       | na            | 100.0                                   |
| Number of births  | 994                         | na            | 3,336                                   |

Note: Risk ratio is the ratio of the proportion dead among births in a specific high-risk category to the proportion dead among births not in any high-risk category.

na = Not applicable

<sup>1</sup> Women are assigned to risk categories according to the status they would have at the birth of a child if they were to conceive at the time of the survey: current age less than 17 years and 3 months or greater than 34 years and 2 months, latest birth less than 15 months ago, or latest birth of order 3 or higher

 $^{\rm 2}$  Includes the category age  $<\!18$  and birth order  $>\!3$ 

<sup>a</sup> Includes sterilized women

() Based on 25-49 unweighted cases

\* Ratio not shown; based on fewer than 25 unweighted cases

# Table 37 Antenatal care

Percent distribution of women who had a live birth in the five years preceding the survey by antenatal care (ANC) provider during pregnancy for the most recent live birth and percentage receiving ANC from a skilled provider, according to background characteristics, Sikkim, 2015-16

| Background characteristic | Doctor | ANM/<br>nurse/<br>midwife/<br>LHV | Anganwadi/<br>ICDS worker | ASHA  | No one | Total | Number<br>of<br>women | Percentage<br>receiving ANC<br>from a skilled<br>provider <sup>1</sup> |

| Other                        | 70.9   | 70.8  | 93.0  | 94.2  | 97.3   | 53.6  | 37.9  | 3.9   | 254                   |
| Total                        | 74.7   | 76.2  | 95.9  | 97.2  | 97.1   | 52.8  | 39.0  | 8.7   | 897                   |

Note: Total includes women belonging to "other" religions and women who don't know their caste/tribe, who are not shown separately.

TT = Tetanus toxoid; IFA = Iron and folic acid tablets or syrup

<sup>1</sup> Includes mothers with two injections during the pregnancy for her last birth, or two or more injections (the last within 3 years of the last live birth), or three or more injections (the last within 5 years of the last birth), or four or more injections (the last within 10 years of the last live birth), or five or more injections at any time prior to the last birth

<sup>2</sup> Full antenatal care includes having received at least four antenatal care visits, having received at least one TT injection, and having taken IFA for 100 or more days

## Table 40 Antenatal care indicators by district

Among women with a live birth in the five years preceding the survey, percentage who received different types of antenatal care (ANC) during the pregnancy for their most recent live birth, and among women with registered pregnancies, percentage who received an Mother and Child Protection Card (MCP Card), by district, Sikkim, 2015-16

| District       | Percentage<br>who had<br>four or<br>more ANC<br>visits | Percentage<br>with an ANC<br>visit in the first<br>trimester of<br>pregnancy | Percentage<br>who took<br>IFA for at<br>least 100 days | Percentage who<br>received two or<br>more TT<br>injections during<br>the pregnancy | Percentage<br>who had full<br>antenatal<br>care <sup>1</sup> | Number<br>of<br>women | Percentage of<br>women who<br>received an<br>MCP Card | Number of<br>registered<br>pregnancies |
|----------------|--|--|--|--|--|-----------------------|---|--|
|                |  |  |  |  |  |                       |   |  |
| East District  | 67.4   | 69.1   | 42.4   | 93.9   | 28.4   | 492                   | 99.1  | 488                                    |
| North District | 73.7   | 80.9   | 70.4   | 96.8   | 50.4   | 47                    | 100.0   | 47                                     |
| South District | 84.7   | 89.5   | 62.9   | 100.0  | 49.5   | 181                   | 98.5  | 179                                    |
| West District  | 84.9   | 81.2   | 66.8   | 96.7   | 54.9   | 177                   | 99.4  | 171                                    |
| Sikkim         | 74.7   | 76.2   | 52.8   | 95.9   | 39.0   | 897                   | 99.1  | 884                                    |

TT = Tetanus toxoid; IFA = Iron and folic acid

<sup>1</sup> Full antenatal care includes having received at least four antenatal care visits, having received at least one TT injection, and having taken IFA tablets or syrup for 100 or more days

## Table 41 Advice received during pregnancy

Among women with a live birth in the five years preceding the survey who met with a community health worker in the last three months of pregnancy for their most recent live birth, percentage who received different types of advice, by background characteristics, Sikkim, 2015-16

|                           |  | Percenta  | ge who received a | advice on:            |                    | Number of women<br>who met with a   |
|---------------------------|--|-----------|-------------------|-----------------------|--------------------|---|
| Background characteristic | Importance of<br>institutional<br>delivery | Cord care | Breastfeeding     | Keeping the baby warm | Family<br>planning | <ul> <li>community health<br/>worker in the<br/>last three months<br/>of pregnancy<sup>1</sup></li> </ul> |
| Age at birth              |  |           |                   |                       |                    |   |
| <20                       | (93.4)                                     | (96.4)    | (94.1)            | (94.1)                | (85.4)             | 40  |
| 20-34                     | 94.6                                       | 95.1      | 98.0              | 97.0                  | 93.9               | 367   |

#### Table 44 Delivery and postnatal care-Continued

Percent distribution of live births in the five years preceding the survey by place of delivery and assistance during delivery, percentage delivered by skilled provider and by caesarean section, percentage of live births delivered at home that were delivered by a skilled provider and percentage for which the delivery protocol was followed, and percent distribution of women giving birth in the five years preceding the survey by timing and type of provider of the first postnatal check of the mother for their most recent live birth, by residence, Sikkim, 2015-16

| Delivery and postnatal care descriptors                         | Urban | Rural | Total |
|---|-------|-------|-------|
| Type of provider of mother's first postnatal check <sup>5</sup> |       |       |       |
| Doctor  | 71.0  | 57.6  | 62.1  |
| ANM/nurse/midwife/LHV   | 12.6  | 19.5  | 17.2  |
| Other   | 0.0   | 2.2   | 1.5   |
| No postnatal check  | 16.4  | 20.7  | 19.3  |
| Total   | 100.0 | 100.0 | 100.0 |
| Number of last live births                                      | 301   | 596   | 897   |

NGO = Nongovernmental organization; ANM = Auxiliary nurse midwife; LHV = Lady health visitor;

TBA = Traditional birth attendant

<sup>1</sup> If the respondent mentioned more than one person attending during delivery, only the most qualified person is considered in this table

<sup>2</sup> Skilled provider includes doctor, auxiliary nurse midwife, nurse, midwife, lady health visitor, and other health personnel

<sup>3</sup> A caesarean section for which the decision to have the operation was made after the onset of labour

<sup>4</sup> Based on the last live birth in the five years preceding the survey

<sup>5</sup> Based on the last live birth in the five years preceding the survey. Postnatal checks are checks on the woman's health within 42 days of the birth

() Based on 25-49 unweighted cases

\* Percentage not shown; based on fewer than 25 unweighted cases

#### Table 45 Delivery and postnatal care by background characteristics

Percentage of live births in the five years preceding the survey delivered in a health facility and percentage delivered with assistance from health personnel, and percentage of women who had a live birth in the five years preceding the survey who received a postnatal check and who received a postnatal check within two days of birth for their most recent birth, by background characteristics, Sikkim, 2015-16

| Background characteristic            | Percentage<br>of births<br>delivered in<br>a public<br>health facility | Percentage<br>of births<br>delivered in<br>a private<br>health facility | Percentage<br>of births<br>delivered in<br>a health<br>facility | Percentage<br>of deliveries<br>assisted by<br>health<br>personnel <sup>1</sup> | Number<br>of<br>births | Percentage<br>of women<br>with<br>a postnatal<br>check <sup>2,3</sup> | Percentage of<br>women with a<br>postnatal check<br>within two days<br>of birth <sup>2,3</sup> | Number<br>of<br>women |

Note: Total includes information on births to women belonging to "other" religions and women who don't know their caste/tribe, which is not shown separately.

na = Not applicable

<sup>1</sup> Health personnel includes doctor, auxiliary nurse midwife, nurse, midwife, lady health visitor, and other health personnel. If the respondent mentioned more than one person attending during delivery, only the most qualified person is considered in this table.

<sup>2</sup> Based on the last live birth in the five years preceding the survey

<sup>3</sup> Postnatal checks are checks on the woman's health within 42 days of the birth

<sup>4</sup> Includes nongovernmental organizations or trust hospitals/clinics

## Table 46 Delivery and postnatal care by district

Percentage of live births in the five years preceding the survey delivered in a health facility, percentage delivered with assistance from health personnel and percentage delivered by caesarean section, and percentage of women who had a live birth in the five years preceding the survey who received a postnatal check within two days of birth for their most recent birth, by district, Sikkim, 2015-16

<sup>1</sup> Health personnel includes doctor, auxiliary nurse midwife, nurse, midwife, lady health visitor, and other health personnel. If the respondent mentioned more than one person attending during delivery, only the most qualified person is considered in this table.

<sup>2</sup> Postnatal checks are checks on the woman's health within 42 days of the birth

## Table 47 Delivery costs and financial assistance

The average out-of-pocket cost paid for delivery for the most recent live birth among women who had a live birth in the five years preceding the survey that was delivered in a health facility by type of facility, and among women who had a live birth in the five years preceding the survey for the most recent birth that was delivered in a health facility, the percentage who received financial assistance under *Janani Suraksha Yojana* (JSY), according to background characteristics, Sikkim, 2015-16

|                           | A                         | werage cost (Rs.) <sup>1</sup> |                        | Percentage who                             | Number of                      |  |

Percent distribution of last births in the five years preceding the survey by time after birth of first health check, and the percentage of births with a health check in the first two days after birth, according to background characteristics, Sikkim, 2015-16

Note: Total includes information on births of birth order 6 or more, births to women belonging to "other" religions, and births to women who don't know their caste/tribe, who are not shown separately.

<sup>1</sup> Includes newborns who received a health check after the first week

<sup>2</sup> Includes nongovernmental organizations or trust hospitals/clinics
 () Based on 25-49 unweighted cases

## Table 50 Trends in maternal care indicators

Maternal care indicators for births during the three years preceding the survey by residence, NFHS-4 and NFHS-3, Sikkim

| Indicator   | NFHS-4<br>(2015-16) | NFHS-3<br>(2005-06) |
|---|---------------------|---------------------|
| URBAN   |                     |                     |
| Percentage who received antenatal care <sup>1</sup>   | 91.7                | 98.0                |
| Percentage who had at least four antenatal care visits <sup>1</sup>                         | 73.8                | 90.2                |
| Percentage who received antenatal care within the first trimester of pregnancy <sup>1</sup> | 76.5                | 86.3                |
| Percentage who received full antenatal care <sup>1,2</sup>                                  | 36.8                | 42.2                |
| Percentage of births delivered in a health facility <sup>3</sup>                            | 97.2                | 87.6                |
| Percentage of deliveries assisted by health personnel <sup>3,4</sup>                        | 98.4                | 92.4                |
| RURAL   |                     |                     |
| Percentage who received antenatal care <sup>1</sup>   | 91.1                | 89.0                |
| Percentage who had at least four antenatal care visits <sup>1</sup>                         | 74.3                | 51.6                |
| Percentage who received antenatal care within the first trimester of pregnancy <sup>1</sup> | 76.6                | 51.6                |
| Percentage who received full antenatal care <sup>1,2</sup>                                  | 41.4                | 22.0                |
| Percentage of births delivered in a health facility <sup>3</sup>                            | 97.0                | 42.9                |
| Percentage of deliveries assisted by health personnel <sup>3,4</sup>                        | 97.5                | 50.0                |
| TOTAL   |                     |                     |
| Percentage who received antenatal care <sup>1</sup>   | 91.3                | 90.3                |
| Percentage who had at least four antenatal care visits <sup>1</sup>                         | 74.1                | 57.1                |
| Percentage who received antenatal care within the first trimester of pregnancy <sup>1</sup> | 76.6                | 56.5                |
| Percentage who received full antenatal care <sup>1,2</sup>                                  | 39.9                | 24.9                |
| Percentage of births delivered in a health facility <sup>3</sup>                            | 97.0                | 48.9                |
| Percentage of deliveries assisted by health personnel <sup>3,4</sup>                        | 97.8                | 55.7                |

<sup>1</sup> Based on the last birth to women in the three years preceding the survey

<sup>2</sup> Full antenatal care includes having received at least four antenatal care visits, at least one tetanus toxoid (TT) injection, and having taken iron and folic acid (IFA) tablets or syrup for 100 or more days

<sup>3</sup> Based on all births in the three years preceding the survey
 <sup>4</sup> Doctor, auxiliary nurse midwife (ANM), nurse, midwife, lady health visitor (LHV), or other health personnel

## Table 51 Male involvement in maternal care: Men's report

Among men age 15-49 whose youngest living child was age 0-35 months, percentage for whom the youngest child's mother received antenatal care, percentage who were present for at least one antenatal care visit, percentage who were told by a health provider or worker at any time during the pregnancy about specific signs of pregnancy complications, percentage to whom a health provider or worker spoke about specific aspects of maternal care at any time during the pregnancy, and percentage whose youngest child was delivered in a health facility, by residence, Sikkim, 2015-16

| Antenatal and delivery care information  | Urban            | Rural        | Total        |
|--|------------------|--------------|--------------|
| Percentage of men for whom the youngest child's mother received antenatal care<br>Percentage of men who were present at any antenatal care visit | (97.8)<br>(97.8) | 94.0<br>83.6 | 95.6<br>89.3 |
| Percentage who were told by a health provider or worker about the following  |                  |              |              |
| signs of pregnancy complications:  |                  |              |              |
| Vaginal bleeding   | (73.2)           | 74.7         | 74.1         |
| Convulsions  | (69.1)           | 73.3         | 71.6         |
| Prolonged labour   | (69.7)           | 77.7         | 74.5         |
| Severe abdominal pain  | (72.8)           | 78.7         | 76.3         |
| High blood pressure  | (79.5)           | 78.8         | 79.1         |
| Percentage ever told what to do if the mother had any pregnancy complications  | (73.4)           | 69.8         | 71.3         |
| Percentage whose youngest child age 0-35 months was delivered in a health facility   | (96.4)           | 93.6         | 94.7         |
| Percentage to whom a health provider or worker spoke about the following   |                  |              |              |
| aspects of maternal care:  | (0, 4, 0)        | 86.8         | 90.0         |

| Note: Table is based on children who stayed in the household the night before the interview. Each of the indices is expressed in standard deviation units (SD) from the median of the WHO Child Growth Standards adopted in 2006. The indices in this table are NOT comparable to those based on the previously used 1977 NCHS/CDC/WHO Reference. Table is based on children with valid dates of birth (month and year) and valid measurement of both height and weight. Total includes information on children of birth order 6 or more, children whose size at birth was very small or was not known, children belonging to "other" religions, children whose caste/tribe is not known, and children whose mother's nutritional status is missing, who are not shown separately. Recumbent length is measured for children under age 2, or in the few cases when the age of the child is unknown and the child is less than 85 cm; standing height is measured for children under age 2, or in the few cases when the age of the child is unknown and the child is less than 85 cm; standing height is measured for children under age 2, or in the few cases when the age 0 the child is unknown and the child is less than 85 cm; standing height is measured for children under age 2, or in the few cases when the age 0 the child is unknown and the child is less than 85 cm; standing height is measured for all other children under age 2, or in the few cases when the age 0 the child is unknown and the child is less than 85 cm; standing height is measured for all other children under age 2, or in the few cases when the age 0 the child is unknown and the child is less than 85 cm; standing height is measured for all other children under age 2, or in the few cases when the age 0 the child is unknown and the child is less than 85 cm; standing height is measured for all other children under age 2, or in the few cases when the age 0 the child is unknown and the child is less than 85 cm; standing height is measured for all other children under age 2, or in the few cases when the age | who stayed in the<br>ndices in this tak<br>rement of both h<br>dren whose caste<br>r children under | e household the<br>ole are NOT cor<br>neight and weigh<br>s/tribe is not kno<br>age 2, or in the | inight before<br>mparable to 1<br>nt. | Mildly anaemic                       | 32.3                     | 28.5                       | 0.0                   | 60.8                        | 221            |
| Moderately/severely anaemic          | 41.9                     | 24.4                       | 3.2                   | 69.5                        | 75             |
| Total                                | 32.4                     | 22.2                       | 0.4                   | 55.1                        | 837            |
| NFHS-3 (2005-06)                     | 28.9                     | 28.4                       | 0.8                   | 58.1                        | 550            |

Note: Table is based on children who stayed in the household the night before the interview. Prevalence of anaemia, based on haemoglobin levels, is adjusted for altitude using the CDC formulas (Centers for Disease Control (CDC). 1998. Recommendations to prevent and control iron deficiency in the United States. *Morbidity and Mortality Weekly Report* 47 (RR-3): 1-29). Haemoglobin levels shown in grams per decilitre (g/dl). Total includes information on children of birth order 6 or more, children belonging to "other" religions, and children whose caste/tribe is not known, which is not shown separately. <sup>1</sup> Excludes children whose mothers were not interviewed

 $^{2}$  For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the household schedule.

 $^3$  Mildly anaemic is classified as 10.0-11.9 g/dl for non-pregnant women and 10.0-10.9 g/dl for pregnant women. Moderately/severely anaemic is <10.0 g/dl. Adjusted for altitude and for smoking status. Excludes children whose mother's anaemia status is not known

() Based on 25-49 unweighted cases

Note: Table is based on women and men who stayed in the household the night before the interview. Prevalence is adjusted for altitude and for smoking status, if known, using the CDC formulas (Centers for Disease Control (CDC). 1998. Recommendations to prevent and control iron deficiency in the United States. Morbidity and Mortality Weekly Report 47 (RR-3): 1-29. Total includes women/men who don't know their caste/tribe, who are not shown separately.

Haemoglobin in g/dl = grams per decilitre.na = Not applicable

<sup>1</sup> For pregnant women the value is 10.0-10.9 g/dl

 $^{2}$  For pregnant women the value is <11.0 g/dl

() Based on 25-49 unweighted cases

\* Percentage not shown; based on fewer than 25 unweighted cases

Percentage of children age 6-59 months classified as having anaemia and percentage of women age 15-49 with anaemia and specific body mass index (BMI) levels by district, Sikkim, 2015-16

Note: Table is based on children/women who stayed in the household the night before the interview. Prevalence of anaemia, based on haemoglobin levels, is adjusted for altitude (and smoking for women) using the CDC formulas (Centers for Disease Control (CDC). 1998. Recommendations to prevent and control iron deficiency in the United States. Morbidity and Mortality Weekly Report 47 (RR-3): 1-29. Haemoglobin levels shown in grams per decilitre (g/dl). The body mass index (BMI) is expressed as the ratio of weight in kilograms to the square of height in meters  $(kg/m^2)$ . <sup>1</sup> For pregnant women, the value is <11.0 g/dl

<sup>2</sup> Excludes pregnant women and women with a birth in the preceding 2 months

nc = No cases

<sup>1</sup> Comprehensive knowledge means knowing that consistent use of condoms every time they have sex, having just one uninfected faithful sex partner can reduce the chance of getting HIV/AIDS, knowing that a healthy-looking person can have HIV/AIDS, and rejecting two common misconceptions about transmission or prevention of HIV/AIDS

<sup>2</sup> Sexual intercourse with a partner who was neither a spouse nor lived with the respondent

() Based on 25-49 unweighted cases \* Percentage not shown; based on fewer than 25 unweighted cases

Table 83.1 Blood pressure status: Women

A woman is classified as having hypertension if she has SBP  $\geq 140$  mmHg or DBP  $\geq 90$  mmHg at the time of the survey, or she is currently taking antihypertension medication to control her blood pressure. The term hypertension as used in this table is not meant to be a clinical diagnosis of the disease, but rather to provide an indication of the disease burden in the population at the time of the survey.

Note: Table is based on women age 15-24 who have ever menstruated. Total includes women belonging to "other" religions and women who don't know their caste/tribe, who are not shown separately.

<sup>1</sup> Respondents may report multiple methods so the sum may exceed 100 percent

<sup>2</sup> Locally prepared napkins, sanitary napkins, and tampons are considered to be hygienic methods of protection

#### Table 98 Spousal violence by background characteristics—Continued

Percentage of ever-married women age 15-49 who have ever experienced emotional, physical, or sexual violence committed by their husband, according to background characteristics, Sikkim, 2015-16

| Background characteristic | Emotional<br>violence | Physical violence | Sexual<br>violence | Physical or<br>sexual<br>violence | Emotional,<br>physical, or<br>sexual violence | Number<br>of<br>women |
|---------------------------|-----------------------|-------------------|--------------------|-----------------------------------|---|-----------------------|
| Caste/tribe               |                       |                   |                    |                                   |   |                       |
| Scheduled tribe           | 1.7                   | 2.2               | 1.6                | 2.3                               | 3.0   | 170                   |
| Other backward class      | 1.8                   | 0.5               | 0.0                | 0.5                               | 2.3   | 141                   |
| Other <sup>3</sup>        | 5.7                   | 4.2               | 2.8                | 4.2                               | 5.7   | 125                   |
| Total                     | 2.7                   | 2.6               | 1.3                | 2.6                               | 3.8   | 462                   |

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women. Total includes women age 15-19, women employed but not for cash, women who have been married more than once, women with 5 or more living children, women belonging to "other" religions, scheduled caste women, and women who don't know their caste/tribe, who are not shown separately.

<sup>1</sup> Currently married women only

<sup>2</sup> Nuclear households are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted, or fostered) with or without unrelated individuals.

<sup>3</sup> Not belonging to a scheduled caste, scheduled tribe, or other backward class

## Table 99 Spousal violence by husband's characteristics and empowerment indicators

Percentage of ever-married women age 15-49 who have ever suffered emotional, physical, or sexual violence committed by their husband, according to his characteristics, marital characteristics, and selected empowerment indicators, Sikkim, 2015-16

| Background characteristic   | Emotional<br>violence | Physical violence | Sexual<br>violence | Physical or<br>sexual<br>violence | Emotional,<br>physical, or<br>sexual violence | Numbe<br>of<br>womer |
|---|-----------------------|-------------------|--------------------|-----------------------------------|---|----------------------|

| 0   | 1.0                   | 0.7               | 0.2                | 1.0                               | 2.0   | 96                    |
| 3   | 3.0                   | 2.8               | 1.5                | 2.8                               | 4.0   | 355                   |
| Afraid of husband   |                       |                   |                    |                                   |   |                       |
| Most of the time  | (6.4)                 | (6.4)             | (6.4)              | (6.4)                             | (6.4)   | 26                    |
| Sometimes   | 3.1                   | 2.9               | 1.5                | 3.0                               | 4.4   | 315                   |
| Never   | 0.9                   | 0.9               | 0.0                | 0.9                               | 1.7   | 121                   |
| Total   | 2.7                   | 2.6               | 1.3                | 2.6                               | 3.8   | 462                   |

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women. Total includes women whose husbands drink alcohol but never get drunk, women whose husbands display 3 or more marital control behaviours, women who gave 3 or more reasons for which wife beating is justified, and women who gave 1-2 reasons for refusing to have sexual intercourse with husband, who are not shown separately.

<sup>1</sup> Currently married women only

<sup>2</sup> Behaviours include: Is jealous or angry if she talks to other men, frequently accuses her of being unfaithful, does not permit her to meet her female friends, tries to limit her contact with her family, insists on knowing where she is at all times, and does not trust her with any money

<sup>3</sup> Currently married women only. Decisions included are decisions about own health care, major household purchases, and visits to her family or relatives

<sup>4</sup> Reasons given for which wife beating is justified include: she goes out without telling him, she neglects the house or children, she argues with him, she refuses to have sexual intercourse with him, she doesn't cook properly, he suspects she is unfaithful, and she shows disrespect for in-laws

<sup>5</sup> Reasons given for refusing to have sexual intercourse with husband include: she knows her husband has a sexually transmitted disease, she knows her husband has sex with other women, and she is tired or not in the mood

# **APPENDIX**

## **ESTIMATES OF SAMPLING ERRORS**

The estimates from a sample survey are affected by two types of errors: (1) non-sampling errors, and (2) sampling errors. Non-sampling errors are the results of mistakes made in implementing data collection and data processing, such as failure to locate and interview the correct household, misunderstanding of the questions on the part of either the interviewer or the respondent, and data entry errors. Although numerous efforts were made during the implementation of the fourth National Family Health Survey (NFHS-4) to minimize this type of error, non-sampling errors are impossible to avoid and difficult to evaluate statistically.

Sampling errors, on the other hand, can be evaluated statistically. The sample of respondents selected in NFHS-4 is only one of many samples that could have been selected from the same population, using the same design and expected sample size. Each of these samples would yield results that differ somewhat from the results of the actual sample selected. Sampling errors are a measure of the variability among all possible samples. Although the degree of variability is not known exactly, it can be estimated from the survey results.

A sampling error is usually measured in terms of the standard error for a particular statistic (mean, percentage, etc.), which is the square root of the variance. The standard error can be used to calculate confidence intervals within which the true value for the population can reasonably be assumed to fall. For example, for any given statistic calculated from a sample survey, the value of that statistic will fall within a range of plus or minus two times the standard error of that statistic in 95 percent of all possible samples of identical size and design.

If the sample of respondents had been selected as a simple random sample, it would have been possible to use straightforward formulas for calculating sampling errors. However, the NFHS-4 sample is the result of a multi-stage stratified design, and, consequently, it was necessary to use more complex formulae. The computer software used to calculate sampling errors for NFHS-4 is programmed in SAS. This procedure uses the Taylor linearization method for variance estimation for survey estimates that are means or proportions. The Jackknife repeated replication method is used for variance estimation of more complex statistics such as total fertility rates and child mortality rates.

The Taylor linearization method treats any proportion or mean as a ratio estimate, r = y/x, where y represents the total sample value for variable y, and x represents the total number of cases in the group or subgroup under consideration. The variance of r is computed using the formula given below, with the standard error being the square root of the variance:

$$SE^{2}(r) = var(r) = \frac{1-f}{x^{2}} \sum_{h=1}^{H} \left[ \frac{m_{h}}{m_{h}-1} \left( \sum_{i=1}^{m_{h}} z_{hi}^{2} - \frac{z_{h}^{2}}{m_{h}} \right) \right]$$

in which

$$z_{hi} = y_{hi} - rx_{hi}$$
, and  $z_h = y_h - rx_h$ 

where

hrepresents the stratum, which varies from 1 to H, $m_h$ is the total number of clusters selected in the  $h^{th}$  stratum, $y_{hi}$ is the sum of the weighted values of variable y in the  $i^{th}$  cluster in the  $h^{th}$  stratum, $x_{hi}$ is the sum of the weighted number of cases in the  $i^{th}$  cluster in the  $h^{th}$  stratum, andfis the overall sampling fraction, which is so small that it is ignored.

The Jackknife repeated replication method derives estimates of complex rates from each of several replications of the parent sample, and calculates standard errors for these estimates using simple formulae. Each replication considers all but one cluster in the calculation of the estimates. Pseudo-independent replications are thus created. In the NFHS-4 sample for Sikkim, there were 215 clusters. Hence, 215 replications were created. The variance of a rate r is calculated as follows:

$$SE^{2}(r) = var(r) = \frac{1}{k(k-1)}\sum_{i=1}^{k} (r_{i} - r)^{2}$$

in which

$$r_i = kr - (k-1)r_{(i)}$$

where

- *r* is the estimate computed from the full sample of 215 clusters,
- $r_{(i)}$  is the estimate computed from the reduced sample of 214 clusters (*i*<sup>th</sup> cluster excluded), and
- *k* is the total number of clusters.

In addition to the standard error, the design effect (DEFT) for each estimate is also computed, which is defined as the ratio between the standard error using the given sample design and the standard error that would result if a simple random sample had been used. A DEFT value of 1.0 indicates that the sample design is as efficient as a simple random sample, while a value greater than 1.0 indicates the increase in the sampling error due to the use of a more complex and less statistically efficient design. The relative standard error (SE/R) and confidence limits (R±2SE) for each estimate are also computed.

Sampling errors for NFHS-4 are calculated for selected variables considered to be of primary interest. The results are presented in this appendix for Sikkim as a whole and for the urban and rural areas of the state. For each variable, the type of statistic (mean, proportion, rate, or ratio) and the base population are given in Table A.1. Table A.2 presents the value of the statistic (R), its standard error (SE), the number of unweighted (N) and weighted (WN) cases, the design effect (DEFT), the relative standard error (SE/R), and the 95 percent confidence limits (R±2SE); for each variable. The DEFT is considered undefined when the standard error for a simple random sample is zero (when the estimate is close to 0 or 1).
