IMPORTANT INSTRUCTIONS TO READERS:

This report is based on data collected from 51,419 households from Madhya Pradesh during 2007-08. From these households, 46,634 ever-married women aged 15-49 years and 9,940 unmarried women aged 15-24 years were interviewed. Most of the tables and analysis presented in the report is based on ever-married women aged 15-49 years. However, for the purpose of comparison with DLHS-2 (2002-04) and the Fact Sheet of DLHS-3, we also provided some indicators based on currently married women aged 15-44 years in selected tables. We request the readers to keep this distinction in mind while using and comparing the DLHS-3 indicators with other surveys.

For more information, visit DLHS website: <http://www.rchiips.org>.

Preface and Acknowledgements

The District Level Household and Facility Survey (DLHS-3) is a nationwide survey covering 601 districts from 34 states and union territories of India. This is the third round of the district level household survey which was conducted during December 2007 to December 2008. The survey was funded by the Union Ministry of Health and Family Welfare, United Nations Population Fund (UNFPA) and United Nations Children's Fund (UNICEF).

We are very grateful to the Ministry of Health & Family Welfare, Government of India for designating the International Institute for Population Sciences (IIPS) as the nodal agency for the DLHS-3 Project and providing an opportunity to work closely with the health and programme officials. In particular, we would like to thank Ms. K. Sujatha Rao, Secretary-Ministry of Health and Family Welfare (MoHFW), Government of India for her advice, suggestions and support. We also thank Shri Naresh Dayal, former Secretary-Ministry of Health and Family Welfare (MoHFW), Government of India for the advice and valuable support extended to the project. Our special thanks to Smt. Madhu Bala, the Additional Director General, Dr. Rattan Chand, the Chief Director and Shri. Rajesh Bhatia, the Director-Statistics Division, Ministry of Health and Family Welfare, Government of India for their active involvement and suggestions. We are also thankful to Dr. V.K. Malhotra and Shri S.K. Das, former Additional Director Generals, Shri Partha Chattopadhyay, former Chief Director, Shri K. D. Maiti, former Director and Ms. Rashmi Verma, former Deputy Director-Statistics Division, MoHFW, Government of India for the co-operation and support at various stages of this project.

We are grateful to Dr. P. N. Mari Bhat, former Director, IIPS and Dr. S. Lahiri, former Officiating Director, IIPS for their keen interest and guidance in the initial stages of the project. We acknowledge the contributions of the TALEEM Research Foundation, Ahmadabad the Regional Agency for the field implementation of DLHS-3 in Madhya Pradesh state. The monitoring of the field survey was done independently by Population Research Centre, Lucknow under the guidance of National Institute of Health and Family Welfare, New Delhi.

Our thanks to the members of Technical Advisory Committee (TAC) of DLHS-3 and especially to its Chairman, Dr. P. M. Kulkarni, Professor, Jawaharlal Nehru University, New Delhi. We also thank Dr. N.K. Singh for guiding the software development and CSPro training for the project staff. We gratefully acknowledge the immense contributions of DLHS-3 project team at IIPS in developing survey instruments, training field staff, monitoring field work, data processing, preparation of district and state level fact sheets, and drafting the reports.

Finally, special thanks to all respondents who spared their valuable time and cooperated with us by providing the required information.

**DLHS-3 Coordinators
International Institute for Population Sciences**

BACKGROUND AND OBJECTIVES OF THE SURVEY

The National Rural Health Mission (2005-2012) was launched by the Government of India (GoI) in 2005-06 to provide effective health care to rural population in the country with special focus on states which have poorer health outcomes and inadequate public health infrastructure and manpower. The primary focus of the mission is to improve access of rural people, especially women and children, to equitable and affordable primary health care. The main goal of NRHM is to reduce infant mortality rate (IMR) and maternal mortality ratio (MMR) by promoting new born care, immunization, antenatal care, institutional delivery and post-partum care.

The National Rural Health Mission (NRHM) foundation is built on community involvement in drawing a village health plan under the auspices of Health & Sanitation Committee of the Panchayat, making rural primary health care services accountable to the community and giving authority to the District Health Mission for implementation of inter-sectoral District Health Plan including drinking water, sanitation, hygiene and nutrition. The interface between the community and the public health system at the village level is entrusted to a female Accredited Social Health Activist (ASHA), a health volunteer receiving performance based compensation for promotion of universal immunization, referral and escort services for reproductive & child health (RCH), construction of household toilets, and other health care delivery programmes. To promote institutional delivery, cash incentive programme under Janani Suraksha Yojana (JSY) is made an integral component of NRHM.

The third round of the District Level Household and Facility Survey (DLHS-3) carried out during 2007-08 was designed to collect data at district level on various aspects of health care utilization for Reproductive & Child Health (RCH), accessibility of health facilities, assess the effectiveness of ASHA and JSY in promoting RCH care, to assess health facility capacity and preparedness in terms of infrastructure of DLHS-3. The integration of facility survey with the household survey was done with a view to link the RCH care outcomes to health facility accessibility, availability of medical & paramedical manpower and other village infrastructures. The broad objective of DLHS-3 is to provide RCH outcome indicators at the district level in order to monitor and provide corrective measures to the NRHM. The other important objective being, to assess the contribution of decentralization of primary health care at the district level and below by way of involving village health committees under the Panchayats in implementation of health care programmes.

The main focus and objective of DLHS-3 is providing RCH indicators covering the following aspects:

Coverage of antenatal check up and immunization services

- Institutional/safe deliveries
- JSY Beneficiaries
- Contraceptive prevalence rates
- ASHA's involvement
- Unmet need for family planning
- Awareness about RTIs/STIs and HIV/AIDS
- Family life education among unmarried adolescent girls
- Health facility and infrastructure

The District Level Household and Facility Survey, 2007-08 (DLHS-3) is the third in the series of district level household surveys. The first one was conducted in 1998-99 followed by the second in 2002-04. For all the three DLHS, the Ministry of Health and Family Welfare (MoHFW), Government of India (GoI) designated the International Institute for Population Sciences (IIPS), Mumbai, as the Nodal Agency responsible for the development of survey design, instruments, data entry and tabulation software, training, supervision of field work, analysis and report writing. The sources of funds for DLHS-3 are the MoHFW, GoI and United Nations Population Fund (UNFPA) and United Nations Children's Fund (UNICEF).

A Technical Advisory Committee (TAC) constituted by the MoHFW, GoI guided the designing, implementation, progress, tabulation, basis of selection of RCH indicators and consistency issues.

SURVEY DESIGN, SAMPLE SIZE AND DESIGN WEIGHT

A multi-stage stratified systematic sampling design was adopted for DLHS-3. In each district, 50 primary sampling units (PSUs) which were census villages in rural areas and census enumeration blocks (CEBs) in urban areas. In rural areas, villages were selected by probability proportional to size (PPS) systematic sampling and in the second stage households were selected by systematic sampling. For urban areas first wards were selected by PPS systematic sampling, in the second stage CEBs by PPS sampling and households in the third stage by systematic sampling. The Census of India, 2001 was the sampling frame for DLHS-3. All villages and urban wards in a district were stratified by household size into three strata of less than 50, 50-300 and 300+ households, percent of SC/ST population into two strata- below and above 20 percent and implicitly by three alternating order of female literacy. These variables used for stratification are from the 2001 Census. The number of households representing a district is either 1000 or 1200 or 1500 considering the levels of immunization, antenatal check up and institutional delivery as given by DLHS-2 plus 10 percent over sampling to cushion for non-response. The PSUs are allocated to rural and urban areas of each district proportionally to the actual rural-urban population ratio and within the rural-urban domains. The PSUs are further distributed proportionately to the different sub-strata of combinations of household size, percent of SC/ST population and levels of female literacy. To make a proper rural PSU, selected villages with less than 50 households were linked with another contiguous village and selection probability is adjusted accordingly. Selected villages with more than 300 households were further divided into two or more segments and one or more segments were selected so as to have standard size PSUs. The numbers of households drawn from a PSU of districts represented by 1000, 1200 and 1500 households are 22, 27 and 33 households respectively. All ever married women age 15-49 years and adolescent's age 15-24 years from the sampled households are the respondents for questions on RCH and family life education, while any adult household member is the respondent for household related questions in DLHS-3.

Sampling weight for household, ever married women and unmarried women were generated for each district. These design weights were used for computations of district level demographic and RCH indicators. The selection probabilities f_1^i , f_2^i and f_3^i at different stages of randomization pertaining to the i^{th} PSU of a district were the main inputs for generation of design weight. These selection probabilities are defined as follows:

$$f_1^i = \text{Probability of selection of } i^{\text{th}} \text{ rural PSU in a district}$$

$$= \frac{(n_r * H_i)}{H}$$

Where, n_r is the number of rural PSUs selected from a district, H_i refers to the number of household in the i^{th} PSU and $H = \sum H_i$, total number of rural households in a district.

$$f_2^i = \text{Probability of selecting segment (s) from segmented PSU}$$

(in case the i^{th} selected PSU is segmented)

= (Number of households in the selected segment) / (number of households in the PSU)

The value of f_2^i is to be equal to one for un-segmented PSU.

$$f_3^i = \text{probability of selecting a household from the total listed households of a PSU or in segment(s) of a PSU}$$

$$= \frac{HS_i}{HL_i}$$

Where HL_i is the number of households listed in i^{th} PSU in a district and HS_i the number of households per PSU assigned for the i^{th} PSU is either 22 or 27 or 33 depending on whether a district is represented by 1000 or 1200 or 1500 households.

For urban PSUs, f_1^i is computed as the ratio of urban population of the selected PSU to the total urban population of the district.

The probability of selecting a household from the district works out as:

$$f^i = (f_1^i * f_2^i * f_3^i)$$

The non-normalized household weight for the i^{th} PSU of the district is, $w^i = \frac{1}{f^i * HR_i}$, where HR_i

is the household response rate of the i^{th} sampled PSU, assumed to be 10 % but actual response rates are used here. The normalized weight used in the generation of district indicators as

$$n_i^d = \frac{\sum_i n_i}{\sum_i n_i * w^i} * w^i, i= 1, 2, 3, \dots, 50.$$

Where n_i is the number of households interviewed in the i^{th} PSU. The weight for women is computed in the similar manner after multiplication of expression for f^i by the corresponding

response rate. State weights for households, women and husbands are further derived from the district weights n_i^d for the i^{th} PSU in d^{th} district using external control so that sample results do not deviate from the corresponding information about the population.

Let, $n_s = \sum_i n_i^d$ and $N_{sc} = \sum_i N_i^d$, denote the number of households in the sample and census of a particular state, then state level households weights work out as:

$$n_i^s = n_i^d * \frac{\left(\frac{N_i^d}{N_{sc}} \right)}{\left(\frac{n_i^d}{n_s} \right)}, \text{ where } n_i^d \text{ represents household sample in } i^{\text{th}} \text{ district, } n_s \text{ is the total}$$

sample in the state. These households' weights are computed for rural-urban areas separately. Considering sample and census currently married women age between 15-49 years and married males above 15 years for specified state by districts and rural-urban residence, state level women weights are obtained for estimation of state level indicators.

IMPLEMENTATION AND QUALITY CONTROL

Actual field operation of DLHS-3 in different states and union territories were implemented by Regional Agencies (RA) selected by the MoHFW through a competitive bidding process, TALEEM research Foundation, Ahmadabad was designated as RA for implementation of DLHS-3 in Madhya Pradesh. Data from the selected PSUs were collected by a team of 5 persons consisting of one Supervisor, one field Editor and three Female Investigators who are graduates at least. A minimum of two days visit to each sampled PSU is followed to ensure 100 percent coverage of selected households, ever married women and unmarried women. Independent team of Health Investigators, mostly paramedics were entrusted the work of carrying out the accompanying Facility Survey. A strict quality check protocol was put in place by the Nodal Agency by way of spot and back checks by an independent team. The Quality team comprised of two females and one male investigator and was headed by a Research Officer from the monitoring agency. One Research Officer from IIPS was stationed in each state throughout the period of the field work.

SURVEY INSTRUMENTS

The main instrument for collection of data in DLHS-3 was a set of structured questionnaires, namely, household, ever married woman, unmarried woman and village questionnaires. Sub-centre, primary health centre (PHC), community health centre (CHC) and district hospital (DH) questionnaires were used to conduct the facility survey. All household level questionnaires were bilingual, with questions in regional and English languages.

Household Questionnaire

The household questionnaire lists all usual residents in each sample household including visitors who had stayed the night before the interview. For individual household member information on age, sex, marital status, relationship to the head of the household and education were collected. Marriages and deaths of members of household were also recorded. Efforts

were made to get information about maternal deaths. Information was also collected on the main source of drinking water, type of toilet facility, source of lighting, type of cooking fuel, religion and caste of household head and ownership of durable goods in the household. The other information collected relates to awareness of government programmes.

Ever Married Women's Questionnaire

The respondents for the ever married women's questionnaire were ever married women age 15-49 years living in the sampled households. Details on age, age at marriage and place of birth, educational attainment, number of biological children ever born and surviving by sex were collected. Accounts of antenatal check-up, experience of pregnancy related complications, place of delivery, delivery attendant and post-partum care, together with history of contraceptive use, sex preference of children and fertility intentions were recorded. For the recent births, immunizations status of children was collected either from the vaccination card or by asking the mother about the status of immunization of the child. The other information collected includes knowledge and awareness about RTIs/STIs and HIV/AIDS by source and treatment seeking behaviour for RTIs/STIs.

Unmarried Women's Questionnaire

Information that was collected from unmarried women age 15-24 years (those under 18 years with consent from the parents) included knowledge of family life education, awareness about legal age at marriage, awareness about contraception, menstruation related problems, and knowledge of RTIs/STIs and HIV/AIDS by source of information.

Village Questionnaire

This questionnaire was designed to collect information on availability and accessibility of education, health, transport and communication facilities at village level. Functioning of village committees and utilization of untied funds were additionally collected from the sampled villages of DLHS.

Facility Survey Questionnaires

In the facility survey the information collected at the Sub-Centre level was availability of human resources, physical infrastructure, equipments and essential drugs and RCH service provided during the one month preceding the survey. Additional information collected at Primary health centre (PHC) level was availability of Lady Medical Officer, functional Labour Room, Operation Theatre, number of beds, drug storage facilities, waiting room for OPD, availability of RCH related equipments, essential drugs and essential laboratory testing facilities. Information that was collected for Community health centre (CHC) included status of in-position clinical, supporting and Para-medical staffs, availability of specialists trained for NSV (Non Scalpel Vasectomy), emergency obstetric, medically terminated pregnancy (MTP), new born care, treatment of RTIs/STIs, IMNCI, ECG etc. Physical infrastructures of CHC such as, water supply, electricity, communication, waste disposal facilities, OT, Labour Room and availability of residential quarters for medical doctors were also collected in the facility survey. (The questionnaires are available at DLHS-3 website: www.rchiips.org).

HOUSEHOLD AND VILLAGE BACKGROUND

DLHS-3 Coverage and Response Rate

DLHS-3 surveyed a total of 51,419 households, 46,634 ever-married women and 9,940 unmarried women in Madhya Pradesh state (Table 1.1). The response rates are 90.7, 82.7 and 81.1 percent for households, ever-married and unmarried women respectively. The lowest response rates for household are found in Jhabua (80.0 percent), for ever-married women in Mandasaur 76.7 percent and for unmarried women in Jhabua, 59 percent respectively. As far as the demographic indicators of Madhya Pradesh are concerned, from 2001 census it can be noted that the overall sex ratio of 920 female per 1,000 males is below the national figure of 933 and there are twenty districts out of the 45 districts where the sex ratio is above 900 and among them 19 districts are above the national average. Mandla (1,002 females per 1,000 males) and Balaghat (1,022 females per 1,000 males) are the two districts where the sex ratio indicate more females than males (Table 1.2).

Village Characteristics

As regards the accessibility of health facilities to the sampled villages, 26 percent of villages have Sub-Centres within the village itself and as many as 75 percent of the villages are within 5 km. distance from a Sub-Centre. In Madhya Pradesh, 2 percent of the villages have a government dispensary within the village and 5 percent have Primary Health Centres (PHC). In Madhya Pradesh, 8 percent villages have private clinics within the villages (Table 2.11). Twelve percent of the rural population are treated by doctors and variation is from 2.4 percent in Shivpuri, Tikamgarh, Rewa and Shaiapur to 47 percent in Indore. Most of the villages (92 percent) have an Anganwadi worker (Table 2.12).

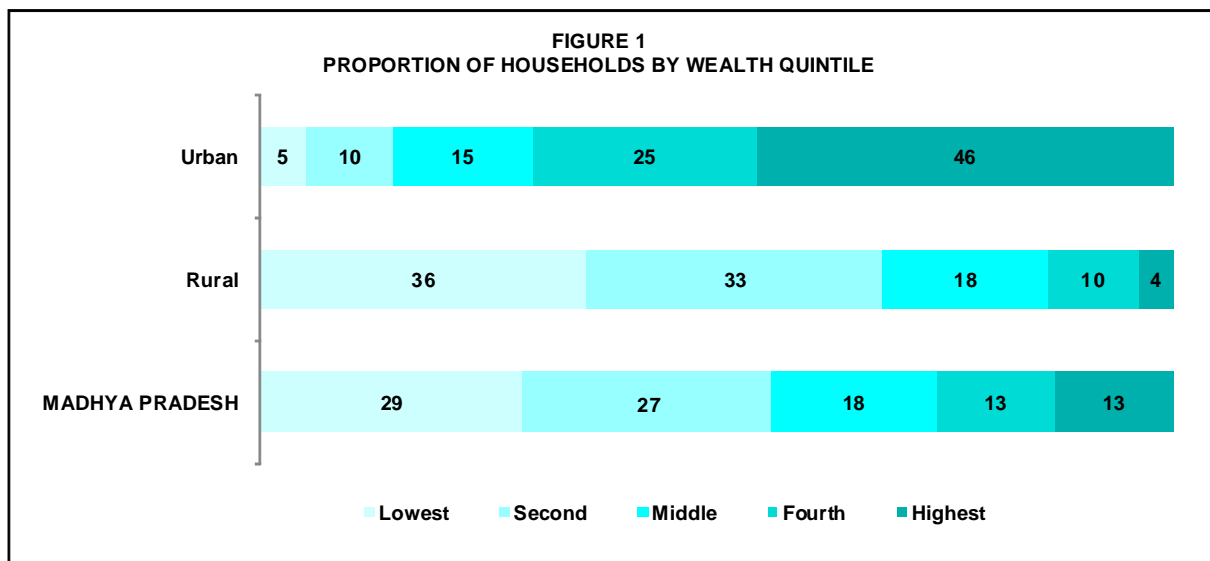

Household Characteristics

DLHS-3 surveyed a total of 418,401 persons (Table 2.1) from 51,419 households (Table 2.8) in Madhya Pradesh covering all the forty-five districts of which 77.4 percent are in rural areas and the remaining 22.6 percent in urban areas. In Madhya Pradesh, 94.5 percent of household heads are Hindus and 4.5 percent are Muslims (Table 2.7). About 5.8 percent of household heads are females. The average household size in the state is 5.6 persons and there is not much difference in rural and urban areas. Sixteen percent of household heads belong to scheduled castes, 24.4 percent belongs to scheduled tribe 41.5 percent belongs to other backward classes and 17.6 percent to others. The median age of household heads is 45 years (Table 2.7).

More than three-fourths (75.6 Percent) of households in Madhya Pradesh have electricity connection, 80.8 percent of households have access to improved source of water, 9.2 percent of the households have access to piped water for drinking into dwelling/yard/plot, 21.1 percent of households have provision for flush toilet, 12.1 percent of households use LPG for cooking, 18.5 percent live in pucca houses and 39.4 percent households have at least 3 rooms (Table 2.8). For the state of Madhya Pradesh, 42.3 percent of households have BPL (below poverty line) cards and it varies from a low of 19.6 percent in Gwalior to a high of 62.9 percent in Rajgarh (Table 2.9).

Household Wealth Index

Combining household amenities, assets and durables, a wealth index has been computed at the national level and divided into quintiles. Households are categorized from the poorest to the richest groups corresponding from the lowest to the highest quintiles at the national level. Based on national cut-off points, in Madhya Pradesh more than one fourths (29 percent) of the households are in the lowest wealth quintile and only around 13 percent households are in the highest wealth quintile (Table 2.8). In rural areas more than two-thirds of the households (68 percent) are in the lowest or in the second lowest wealth quintile and in urban areas about three-fourths of the households (70.2 percent) are in the highest or in the fourth highest wealth quintile, shown in Fig. 1.

Age-Sex Composition

The overall sex ratio in Madhya Pradesh is 945 females per 1000 males. The age-sex pyramid (Fig.2) depicts a scenario of declining fertility with a shrinking base of 34.8 percent of the total population below 15 years and 5.2 percent of the population being above the age of 65 years. The remaining 60 percent of the population is in the 15-64 years age group. There are more children (36.4 percent) in rural areas than in urban areas (29.6 percent) (Table 2.1).

The mean age at marriage of boys and girls in Madhya Pradesh are 21.7 years and 18.4 years respectively. In Madhya Pradesh, 40.5 percent of boys and 29 percent of girls were married off before attaining the minimum legal age for marriage (Table 2.3).

Literacy by Age and Sex

Thirty-seven percent of the population 7 years and above are non-literate and there is wide gender disparity with corresponding figures for males and females being 26 and 48.7 percent respectively. There are noticeable gender gaps in rural areas in the age groups 10-14 (12.7 percent for male and 17.3 percent for female) and 15-19 years (12.9 percent for males and 27.9 percent for females) (Table 2.4).

Figure 3 capture the proportion literates for broad age groups 7-9, 10-14 and 15-19 years by sex. The information on the main reasons for dropping out of school was also collected in

DLHS-3. For girls below 18 years as many as 18.4 percent stated that they were required for household work followed by 11.7 percent said that they were not interested in studies and 11.2 percents who said further education were not necessary as the main reason for dropping out of school respectively. The reported main reason for dropping out of school for boys are not very different, 21.7 percent boys said that they were not interested in studies, followed by 12.6 percent who stated they were required for household work (Table 2.6).

CHARACTERISTICS OF WOMEN AND FERTILITY

Age at consummation of marriage is at least 18 years for 58 percent of ever married sampled women between 15-49 years irrespective of residence. Proportion of non-literate women is more in rural areas (64.4 percent) than in urban areas (31.3 percent) of Madhya Pradesh. In urban areas, the proportion of husbands who are non-literate are lesser than that of women, only 13.6 percent of husbands are non-literate in urban areas. In Madhya Pradesh, 11 percent of married women and 26 percent of married men have at least 10 years education. More than half (51 percent) of ever married women were married for 15 years or more and the other half of ever married women is almost equally distributed in the categories of less than 5 years, 5-9 and 10-14 years marital duration, about 17 percent in each category (Table 3.1).

In Madhya Pradesh 24.6 and 26.6 percent of women belong to households in the lowest and second lowest wealth quintiles. In rural areas women belong to the lowest and second lowest wealth quintile are respectively 30.7 and 31.9 percent while in urban areas these are 3.6 and 8.4 percents respectively.

Mean Children Ever Born by Districts

Mean children ever born (CEB) to ever married women between 15-49 years is found to be 3.1 with a small differential by residence (3.2 in rural and 2.8 in urban), while it is 3.7 for non-literate and 1.9 for women with at least 10 years of education. The completed fertility measured in terms of average children ever born to ever married women between 40-49 years is 4.6

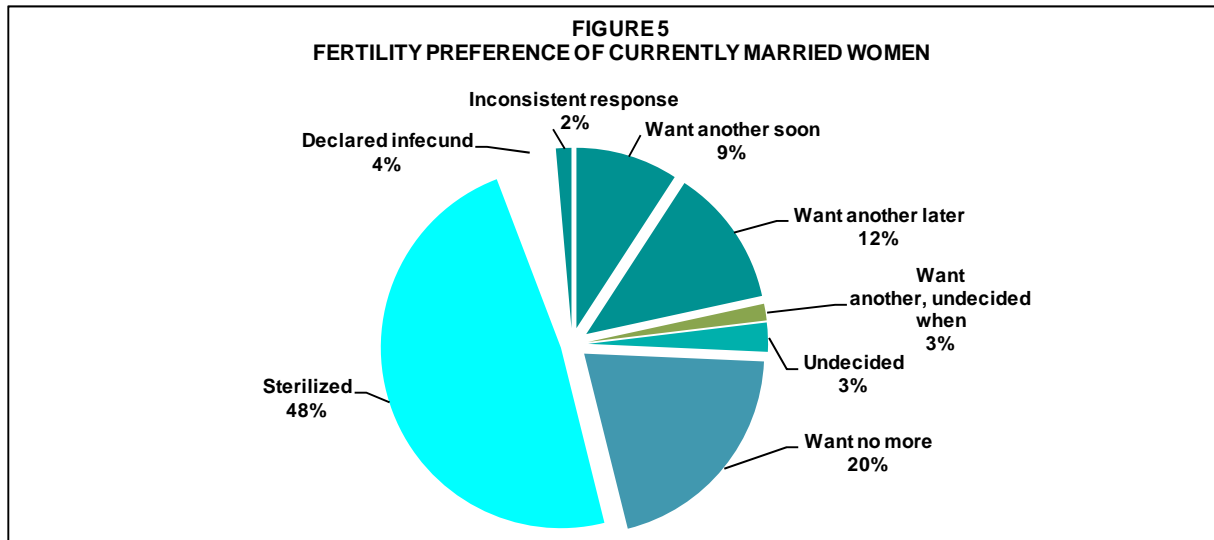

(Table 3.5). Mean children ever born in the districts of Madhya Pradesh ranges from 2.6 to 4 in Indore and Jhabua respectively as shown in Fig 4.

Out of the births to ever married women during the three year period preceding the survey, 32.8 percent were of third or higher order births and the corresponding figures were 41.8 and 12.3 percents for non-literate and for the ever-married women with 10 more years of schooling respectively (Table 3.3). The births of third and higher order were more among the ever married women who live in rural areas (34.1 percent), women belonging to households in lowest wealth quintile (41.5 percent) and those belonging to scheduled tribe (42.6 percent) and less to ever-married women in urban areas (27.1 percent), those belonging to other castes (24.2 percent) and those belonging to households in highest wealth quintile (17.5 percent). Births of third and higher order are highest in Jhabua (54.3 percent) and lowest in Balaghat (26.6 percent) (Table 3.4).

Fertility Intention and Preference of Currently Married Women

Fertility intentions of currently married women in terms of desire for additional child and timing to have the desired additional child among those with no living child was 44.2 percent want a child soon within the next two years and 28.2 percent want a child 2 or more years later (Table 3.6). Among the currently married women with one living child, the proportions wanting an additional child soon within 2 years and after 2 years are 17.5 and 42.3 percent respectively. About half of the currently married women with two or more living children are either sterilized or want no more children. Fig. 5 shows that as many as 20.4 percent of currently married women want no more children, 9.2 percent want a child soon, 2.6 percent are undecided and 48.1 percent have undergone sterilization.

Among the currently married women with no living children but want a child, 44 percent reported that sex of the child does not matter, 32.4 percent say it is up to god while 21.2 and 2.3 percent want a boy and a girl respectively. With increasing number of living children, longing for a boy among the currently married women who want an additional child, becomes more and more magnified from 40.7 to 87.1 percent for women with one and four or more living children respectively.

Almost all the outcomes (95.5 Percent) of pregnancies which occurred during the three years period preceding the survey to currently married women between 15-49 years are found to be live births (Table 3.7). In Madhya Pradesh, 3 percent of the pregnancies in the three years period preceding the survey resulted in spontaneous abortion and varies from 0.7 percent in Guna to 7.4 percent in Indore (Table 3.8).

MATERNAL HEALTH CARE

Maternal health care package for antenatal care is the main programme of NRHM to strengthen RCH care. ANC provided by a doctor, an ANM or other health professional comprises of physical checks, checking position and growth of foetus and giving TT injection at periodic intervals during the time of pregnancy. At least three check-ups are expected to complete the course of ANC to safeguard women from pregnancy related complications. Institutional delivery and post-natal care in a health facility is promoted in NRHM through the Janani Suraksha Yojana (JSY) to avert maternal deaths.

Any ANC by Selected Background Characteristics

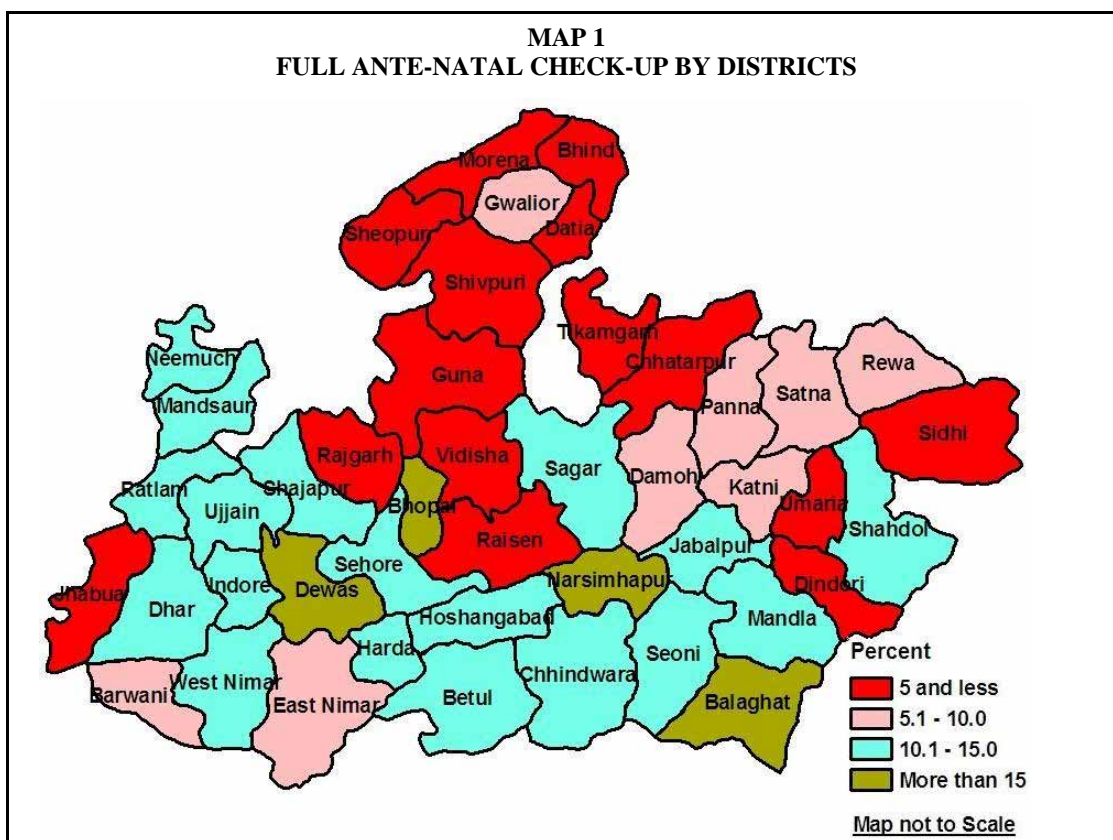

Among women who had their last live/still birth in the three year period preceding the survey, 61.7 percent received at least one antenatal check, 51.5 percent from government health facility and 26.8 percent from private health facility and 7.9 percent from community based services (Table 4.1).

A distinctive differential by background of the women is that any ANC is low at 48.8 percent among non-literate as against 90.7 percent among women educated for 10 or more years; rural-urban gap is 25.4 percentage points, with 82.0 percent among urban residents as depicted in Fig. 6.

The coverage of ANC is highest in Ujjain (90.8 percent) and lowest in Shivpuri (32.3 percent). In all districts of Madhya Pradesh, women availed ANC service from either a government or private health facility or from both the facilities. For women in Katni district, 70.6 percent have ANC from a government facility and 20.5 percent received it from a private facility, while the corresponding government and private health facilities utilization for ANC in Betul are 36.3 and 23.3 percent respectively (Table 4.2).

All checks and examinations recommended for ANC are not availed by some women who had ANC during pregnancy. The proportion of women who have weight and height measured, blood pressure checked, blood and urine tested, abdomen, breast examined and sonography/ultra sound test are 42.8, 16.5, 30.0, 36.2, 37.2, 43.1, 18.8 and 15.5 percent respectively (Table 4.3). The proportion of women who went for sonography/ultra sound test is higher in urban areas (35.2 percent), among women with 10 or more years of schooling (51.2 percent), and women belonging to the households in the highest wealth quintile (54.5 percent) (Table 4.3).

The proportion of women who received at least three ANC is 34 percent and 33.7 percent women had received first ANC in the first trimester (Table 4.5A), 60.1 percent women had received at least one TT injection and 8.6 percent of the women received full ANC in Madhya Pradesh (Table 4.5B). In Guna a lowest 1.0 percent and in Balaghat district a highest of 22.8 percent of the women had received full ANC (Table 4.6). District wise variation in coverage of full ANC is shown in the Map 1. The proportions of women who consumed 100 IFA tablets and received at least two TT injections are 50.0 percent & 60.1 percent respectively (Table 4.6).

Institutional Delivery

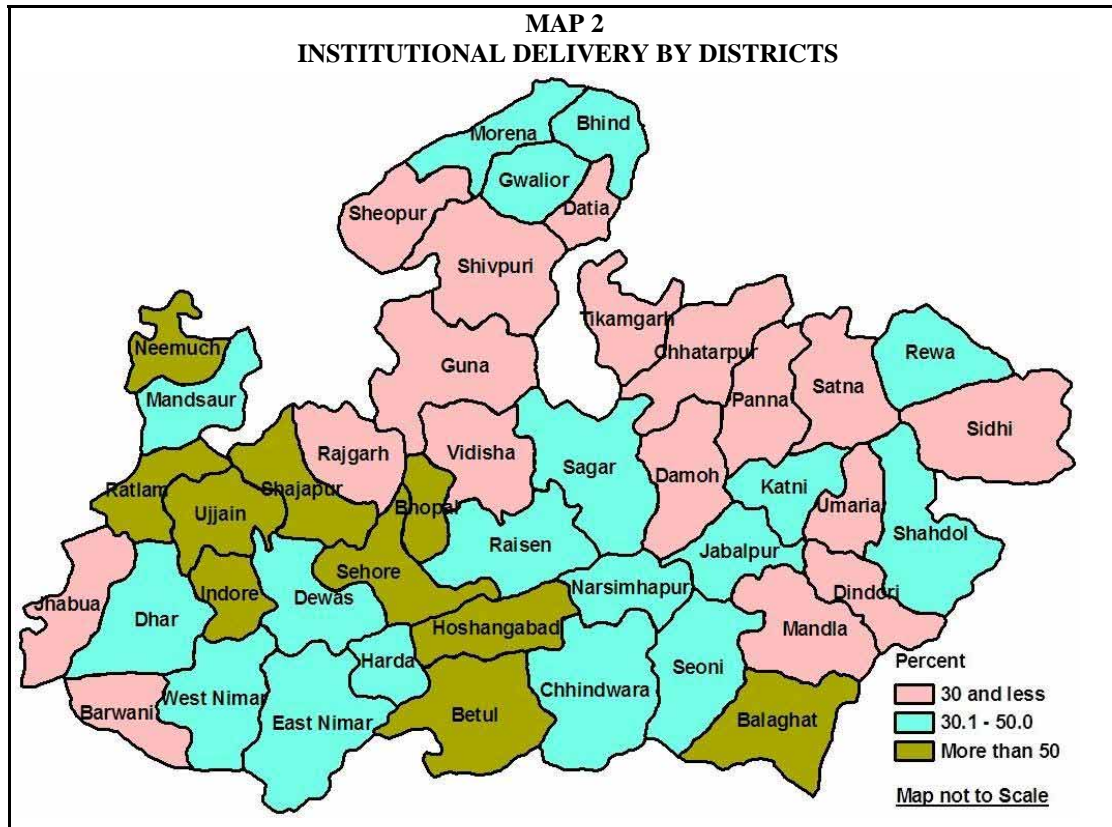

In Madhya Pradesh, the institutional delivery had increased from 22 percent in DLHS-1 (1998-99) to 28 percent in DLHS-2 (2002-04) to 47 percent in DLHS-3 (2007-08), presented in Fig. 7. Forty-seven percent of deliveries in the three year period preceding the survey which results either in still or live births were done in health facilities, either public or private (Table 4.9). The percentage of institutional delivery ranges from 13.2 percent in Dindori to 79.7 percent in Indore, and is presented in Map 2.

The percentage of safe delivery is 84.7 percent in Indore and 71.8 percent in Shajapur respectively. In Bhopal, Neemuch, Ratlam, Jabalpur, Hoshangabad, Gwalior, Dewas, and Ujjain, it ranges from 60.8-69.6 percent, in 13 districts safe deliveries were more than 50 percent. In 22 districts safe deliveries were less than 50 percent and in Dindori it was 15.6 percent (Table 4.9).

In Madhya Pradesh, 34.6 percent of the deliveries which took place in institutions after January 1, 2004 have been provided with JSY financial assistance (Table 4.8). The mean cost of delivery at government health facility is Rs.1,470/- against Rs.7,380/- for delivery in private health

facility. Woman who had used an ambulance or jeep or car as the mode of transport for delivery the mean cost of transportation is transportation is Rs.435/-. The main reasons for not going to health institutions as reported by women who have delivery at the home are no time to go (32.8 percent), and not necessary (27.2 percent) (Table 4.10).

Complications during Pregnancy, Delivery and Post-delivery Period

Women who either do not take ANC or take an incomplete course of ANC are exposed to the risk of maternal death. In Madhya Pradesh, as much as 61.3 percent of women had some complications during pregnancy (Table 4.14). This varies from 78.6 percent in Bhopal to 39.9 percent in Shivpuri (Table 4.15). Only in 9 districts out of 45 districts in Madhya Pradesh less than fifty percent of women had pregnancy complications- Shivpuri (39.9 percent), Guna (41.8 percent), Bhind (44.9 percent), East Nimar (46.1 percent), Vidisha (47.4 percent), West Nimar (47.5 percent), Morena (47.9 percent), Balaghat (49.6 percent) and Datia (49.8 percent). On the other hand in more than seventy percent of women had delivery complications, 14 districts viz. Sheopur (70.3 percent), Sagar (70.3 percent), Ujjain (70.5 percent), Mandla (70.9 percent), Tikamgarh (71.6 percent), Satna (71.7 percent), Sehore (72 percent), Raisen (72.1 percent), Neemuch (72.3 percent), Umaria (72.6 percent), Narsimhapur (73 percent), Dewas (74.6 percent), Indore (76.3 percent) and Bhopal (78.6 percent) majority of the women had pregnancy complications. Among the women, who had complications during pregnancy 50 percent of them sought treatment (Table 4.15).

About two-thirds (66.5 percent) of women in Madhya Pradesh had faced at least one delivery complication (Table 4.11). The main cause of delivery complications are premature labour (55 Percent), prolonged labour and obstructed labour (38.2 percent each). Delivery complication is lowest in Vidisha (33.9 percent) and highest in Umaria (93.3 percent). In eighteen districts more than 70 percent of women experienced delivery complications and in only three districts less than 50 percent women had delivery complications, the districts of Vidisha (33.9 percent), Shivpuri (34.6 percent) and Betul (42.8 percent) (Table 4.15).

More than two-fifths (41.6 percent) of women in Madhya Pradesh had post-delivery complications. The major problem during post delivery period were high fever (59.8 percent) followed by lower abdominal pain (59 percent) (Table 4.12). Among the women who had post-delivery complications, 48.8 percent had sought treatment. The highest is 71.2 in Shajapur and the lowest is 24.6 percent in Sidhi. In 20 districts out of 45 districts 51.5-63.8 percent women who had post-delivery complications sought treatment; on the other hand, in the 24 districts 33.7 - 49.9 percent women sought treatment for post delivery complications in Madhya Pradesh (Table 4.15).

CHILD HEALTH CARE AND IMMUNIZATION

To promote child survival and prevent infant mortality, NRHM envisages new born care, breastfeeding and food supplementation at the right time and a complete package of immunization for children. Little less than two-fifths (39.4 percent) of newborns during the three year period preceding the survey were examined within 24 hours of birth. More newborns to women of urban residents (59.4 percent), newborns to women educated up to 10 or more years (72.3 percent) and belonging to Jain (85.2 percent) have received newborn care within 24 hours compared to others. More than three-fourths (76.5 percent) of the women in Madhya Pradesh who had delivered in the three year period preceding the survey availed newborn check up within 24 hours from government facility. Women who availed newborn cares from a private health facility constitute 19.3 percent as compared to home (3.7 percent) and others (0.5 percent) (Table 5.1).

Eighty-three percent of children below 3 years, born after January 1, 2004 were fed with colostrum (Table 5.2). Women who have urban residence (85.6 percent), more than 10 years of education (91.1 percent), belonging to Jain religion (96.4 percent) and from richest households (88.6 percent) are more likely to give colostrum to their child than their counterparts who live in rural areas (82.4 percent), non-literate (79.2 percent), and from poorest households (79.8 percent) (Table 5.2). There is visible variation across districts, in the districts of Dewas, Rewa, Bhopal, Raisen, Damoh, Jabalpur, Shajapur, Jhabua, Satna, Sidhi, Balaghat, Betul, Sehore, Shahdol, Umaria, Dindori, Ujjain, Sagar, Chhindwara more than 90 percent of children being fed colostrum and in the other districts it ranges from 57.3 to 89.8 percent (Table 5.5).

Median duration of exclusive breastfeeding of the youngest surviving child is 4.3 months (Table 5.3). For those children who had started food supplementation while still breastfeeding, median age in months at the time of other fluids, semi-solid food and solid food supplementation are 6.0 months, 8.4 months and 11.8 months respectively. The proportion of youngest surviving who have exclusively breastfed for 6 months is 51.3 percent (Table 5.4).

Little more than two-fifths (42.7 percent) of women had initiated breast milk within one hour of birth of the child. The initiation of breastfeeding within one hour of birth is least practiced among women in Sheopur (27.8 percent) and most widely practiced in Betul (70.9 percent). Seventy-two percent of women initiate breastfeeding within 24 hours of the birth of their children, and this range from 55.6 percent in Tikamgarh to 87.9 percent in Betul (Table 5.5).

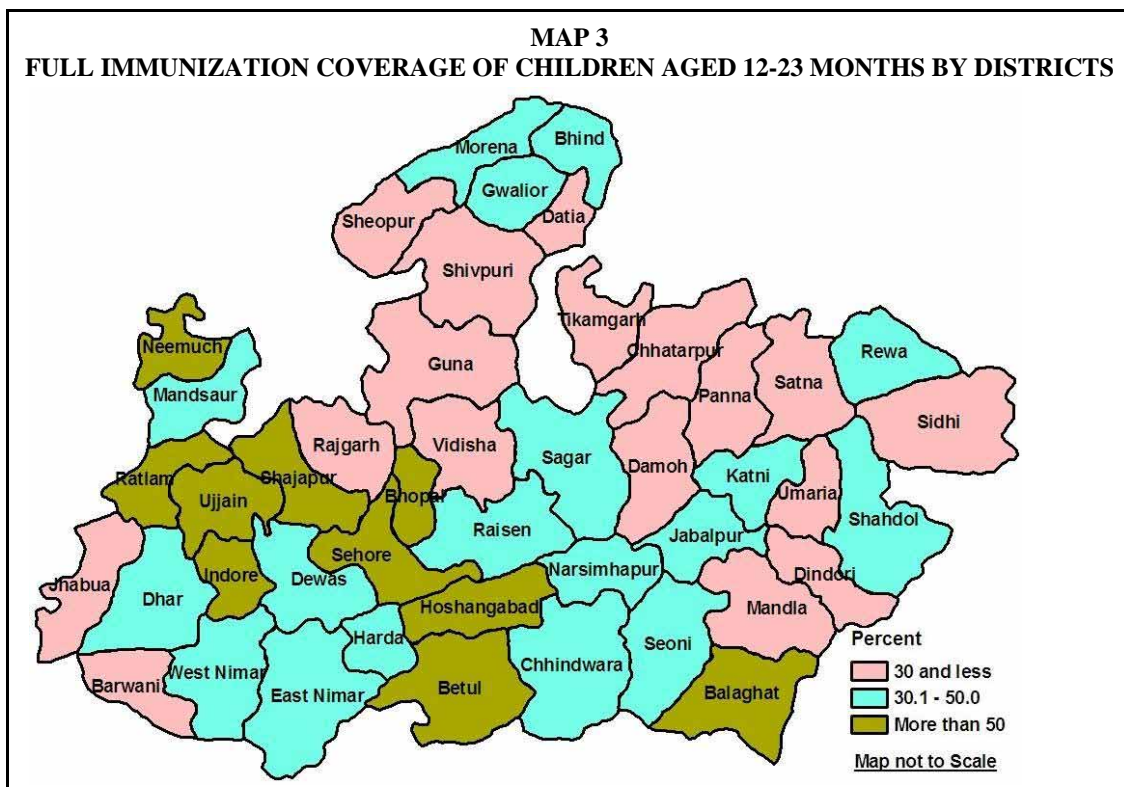

Immunization Coverage of Children Aged 12-23 Months

In DLHS-3 immunization course of children aged 12-23 months has been recorded either from vaccination card or by questioning the women in case child was given immunization but the card was not shown. For 26.5 percent of immunization coverage of children were recorded from the card in Madhya Pradesh. Thirty-six percent of children aged 12-23 months received full immunization comprising of BCG, three doses of DPT, three doses of Polio (excluding Polio 0) and measles (Table 5.6). Only 9.6 percent of children have not received any vaccine (Table 5.6).

The coverage of full immunization, decreased from DLHS-1 to DLHS-2 (48 percent to 30 percent) but it had increased slightly to 36 percent in DLHS-3, as shown in Fig.8. The coverage of full immunization of children is below 50 percent in 35 districts out of 45 districts in Madhya Pradesh, and it is more than 70 percent in Indore (70.5 percent) and Balaghat (70.8 percent) districts (Table 5.7). As regards the place of immunization, 4.4 and 7.6 percent of children received immunization from a Sub-Centre and Primary Health Centre (PHC) respectively and about 78.8 percent from other government health facility (Table 5.8).

Full immunization coverage would have been well above 70 percent, if immunization against DPT did not drop down 27.1 percentage point for first (74.3 percent) and third (47.2 percent) doses and had vaccination against polio not dropped to 32.7 percentage points for first (87.7 percent) and third (55.0 percent) doses. The coverage of measles vaccine (57.4 percent) was 26.8 percentage points lower than the coverage of BCG vaccine (84.2 percent). The key to improvement in full immunization coverage is to monitor drop out at any stage of vaccination before completion of full course of immunization. The differentiation in coverage of the vaccination is marginal with the sex of the child. Higher coverage of full vaccination is observed among the urban residents (54.2 percent), births of first order (39.1 percent) and children born to women educated up to 10 or more years (60.6 percent), children belonging to the other caste/tribe (50.1 percent) and children from household in the highest wealth quintile (62.6 percent) and it is lower among the children of women of rural residence (31.2 percent), births of order four and above (28.3 percent), children of non-literate women (24.5 percent), children whose mothers belongs to scheduled tribe (24.7 percent) and children of women belonging to households in the lowest wealth quintile (19.1 percent) (Table 5.6). District-wise variation in coverage of full Immunization is depicted spatially in the Map 3.

In Madhya Pradesh, 41.1 and 10.9 percents of children aged 12-35 months had received at least one dose and 3-5 doses of vitamin-A supplementation respectively (Table 5.9). Immunization coverage of children from urban residence (55.8 percent), richest households (66.3 percent), other caste groups (54.6 Percent), mother's education were 10 or more years (70.0 percent), lower birth order (43.0 percent) are more likely to receive at least one dose of Vit.-A than children from rural residence (37.4 percent), poorest households (26.8 percent), scheduled tribes (32.7 percent), non-literate mothers (30.0 percent), children of four or more birth order (32.9 percent). In Shivpuri only 16.3 percent children aged 12-23 months received at least one dose of Vit.-A, only Balaghat and Ujjain are the districts of Madhya Pradesh where coverage of Vit.-A is more than 70 percent and other 11 districts have less than 30 percent coverage of Vit.A (Table 5.7).

Only 13.9 percent children had been given Hepatitis-B vaccination (Table 5.9). In Madhya Pradesh children living in urban areas (26.3 percent), lower birth order (15.5 percent), mother's having 10 or more years of education (36.3 percent), those belonging to other caste groups (22.8 percent) and from richest households (33.7 percent) are more likely to receive Hepatitis-B injection than children living in rural areas (10.8 percent), 4 or more birth order (9.0 percent), non-literate mothers (7.8 percent), those belonging to scheduled tribes (8.5 percent) and from poorest households (6.2 percent).

Diarrhoea and Acute Respiratory Infection (ARI) Management

DLHS-3 collected information on knowledge of diarrhoea and ARI management from women respondents as a part of assessment of child care knowledge. More than two-thirds (68.2 percent) of women have knowledge of diarrhoea management (Table 5.10) and are aware of danger signs of ARI (66.0 percent) (Table 5.12).

The common practice followed by women for treatment of children who had diarrhoea was to give ORS (53.8 percent), salt and sugar solution (41.3 percent), continue normal food (11.9 percent) and plenty of fluids (11.7 percent) (Table 5.10). Thirty percent children who suffered from diarrhoea were treated by ORS, and 64.0 percent of them sought advice/treatment (Table 5.11). Only 39 percent children who had suffered from diarrhoea are treated in a government health facility and 61.2 percent in a private health facility (Table 5.11). In Sheopur 25.3 percent children suffered from diarrhoea in the last two weeks prior to the survey and among them 56.2 percent sought advice/treatment and in East Nimar 2.3 percent children suffered from diarrhoea and 69.2 percent of them sought advice/treatment. There are seven districts where less than 50 percent children sought treatment for diarrhoea in Madhya Pradesh (Table 5.13).

Two-thirds of women are aware about the danger signs of ARI in Madhya Pradesh. Among the women aware of danger signs of ARI 63.9, 63.4, 57.2 and 52.1 percent of women know that difficulty in breathing, pain in chest and productive cough, wheezing/whistling and rapid breathings are the danger signs of ARI respectively (Table 5.12). Thirteen percent of the children had suffered from ARI in the last two weeks prior to the survey. Sixty-eight percent of the children who had suffered from ARI or fever two weeks prior to the survey had sought advice/treatment mostly at a private health facility (66.5 percent) (Table 5.12).

The prevalence of ARI among children varies from 1.2 percent in East Nimar to 30.7 percent in Dindori. In seven districts of Madhya Pradesh the percentage who sought advice/treatment for ARI or fever is above 80 percent, in rest of the districts it varies from 35.0 percent to 78.8 percent (Table 5.13).

FAMILY PLANNING AND CONTRACEPTIVE USE

To achieve population stabilization and promote healthy married life, NRHM promotes contraceptive use on voluntary basis through a comprehensive package of improved accessibility and incentive programme. There is near universal awareness of sterilization for limiting and IUD, Pills and Condom for spacing of children among ever married and currently married women in Madhya Pradesh (Table 6.1). Female condom is least known among women with just 8.5 percent being aware of this contraceptive method. Emergency contraceptive pills, injectables, withdrawal and rhythm method were known to 28.5, 49.4, 28.8, and 38.9 percent of currently married women. Similar pattern of knowledge and awareness of different contraceptives are also found in all the districts of Madhya Pradesh (Table 6.3). Among the currently married women, the proportion using any modern method is 54.8 percent, while 63 percent of currently married women had ever used either modern or traditional methods (Table 6.5A) (Fig.9).

The proportion of currently married women who had ever used oral pills and IUD constitute only 5.8 and 2.1 percent (Table 6.4). Female sterilization is predominant among all the contraceptive methods being ever used by 47.1 percent of currently married women between 15-49 years and popular male oriented spacing or temporary methods like condom/*nirodh* is being used by 4.2 percent of husbands of currently married women (Table 6.5A).

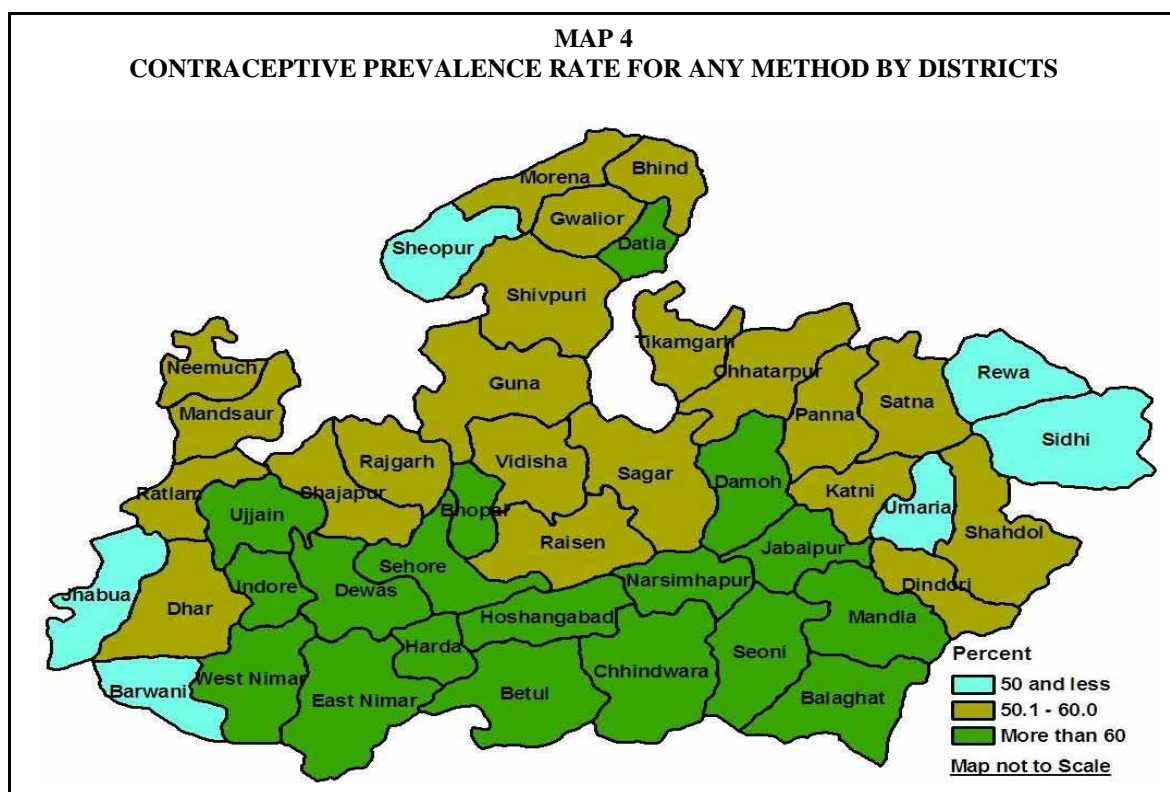

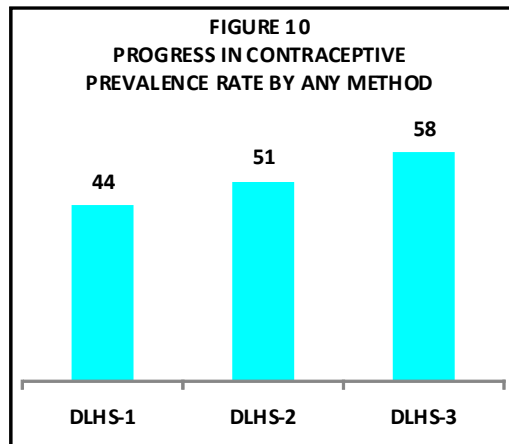

More than 60 percent of women between 30-49 years are sterilized and female sterilizations are more prevalent among rural women (48.9 percent) and non-literate (53.3 percent) women. The urban women (40.9 percent) and women educated for at least 10 years (26.5 percent) are less likely to use female sterilization (Table 6.4).

Differential in contraceptive use among currently married women by selected background characteristics are urban resident (62.3 percent), women in the elderly age group (45-49 age group, 72.2 percent), women belongs to other caste/tribe group (64.4 percent) and women from richest households (66.9 percent) as compared to their counter parts in the rural areas (56.5 percent), scheduled tribe (50.2 percent) and women from poorest households (49.4 percent). Women in the urban areas, with more than 10 years education, belongs to other caste/tribe and from richest households are less likely to use female sterilization and more likely to use IUD, Pill, Condom/*nirodh* (Table 6.5 A).

Among the currently married women using IUD as a spacing method, the proportion continuing IUD for less than 2, 2-3 and more than 4 years are 40.4, 32.3, and 27.3 percent respectively (Table 6.5B). Oral pill users continuing for more than 6 months constitute 62.2 percent of the total users and 68.8 percent of condom users are continuing with the same method for longer than 6 months (Table 6.5B). Female sterilization regardless of family size is more among currently married women who have one or more living sons compared to those with no living son. More than one-fourths (27.8 percent) of women between 20-24 years, 39.8 percent of women between 25-29 years and 20.8 percent of women between 30-34 years have been found to have undergone female sterilization at the time of survey. Mean age of women at sterilization is 27.3 years (Table 6.6).

Contraceptive Prevalence Rate for Any Method

The contraceptive prevalence rate for any method had changed by 7 percent points from 44 to 51 percent in DLHS-1 to DLHS-2 and then to 58 percent in DLHS-3 (Fig.10). Contraceptive prevalence rate (CPR) for any modern method ranges from 41.1 to 59.6 percent in 31 districts and it is more than 60 percent in Sehore, Harda, Mandla, Indore, Betul, East Nimar, Seoni, Hoshangabad, Ujjain, Jabalpur, Dewas, Narsimhapu, West Nimar, Damoh (Table 6.7). The prevalence of female sterilization in the 23 districts, namely Sidhi, Bhopal, Sheopur, Chhatarpur, Shivpuri, Jhabua, Rewa, Rajgarh, Umaria, Morena, Gwalior, Satna, Bhind, Vidisha, Shahdol, Raisen, Guna, Barwani, Neemuch, Sagar, Katni, Panna, Mandasaur are below the state average (47.1 percent). The use of condom is the least (1 percent) in Dindori and highest in Bhopal (12.5 percent). District-wise variation in CPR of any methods is depicted spatially in Map 4.

The contrast in the source of terminal and temporary methods of contraceptives is found in the state, 95.4 percent of sterilization has been done in a government health facility and only 24.1 percent have availed government health facility services for spacing methods (Table 6.8). The

high and low utilization rate of government health facility for limiting and spacing methods is true for all the districts of Madhya Pradesh. In Madhya Pradesh more than three-fourths (78.5 percent) of sterilized women and wives of sterilized men who had undergone sterilization three years preceding the survey got monetary compensation for sterilization and as much as 95.5 percent of them at the time of discharge. In Indore the lowest proportion is 52.9 percent and 92.9 percent in Dindori received cash benefits for sterilization (Table 6.9).

In Madhya Pradesh, 33.2, 44.6 and 33.2 percents of sterilized women, users of IUD and Pills were informed about the side effects before the adoption and 18.7, 10.6 and 11.4 percent of women using the aforesaid methods have experienced side effects or health problems respectively (Table 6.10).

The main health problems/side effects faced by women who have undergone sterilization are body/back ache (57.5 percent), abdominal pain (54.1 percent), weakness/inability to work (50.5 percent) followed by irregular periods (17.6 percent). For women using IUD, the main problem is irregular periods (43 percent), weakness/inability to work (35.5 percent), body/back ache (34.4 percent), abdominal pain (31.5 percent) followed by excessive bleeding (30.7 percent) and spotting (13.4 percent). Among the Pill users the main problem was dizziness (42.9 percent), weakness/inability to work (32.1 percent), and irregular periods (29.9 percent) followed by body/back ache (24.6 percent), Nausea/vomiting (21 percent) (Table 6.10).

Among currently married women who have discontinued contraception the main reason cited was related to fertility (72.1 percent), while 9.7 percent mentioned side effects and 18.2 percent cited other reasons. For younger women between 15-29 years reasons for discontinuation of contraception are mostly fertility related and it is also true for women with no living children or women having only one child (Table 6.11). Twenty-one percent of currently married women between 15-49 years not using any contraceptive method intend to adopt limiting and 1.3 percent spacing method in future (Table 6.12). Among the women who intended to adopt either limiting or spacing methods in future, 29.4 percent want to use it within 12 months and 17.8 percent want to use it after 12 months. The remaining 52.8 percent women are still undecided about the timing for adopting any family planning method.

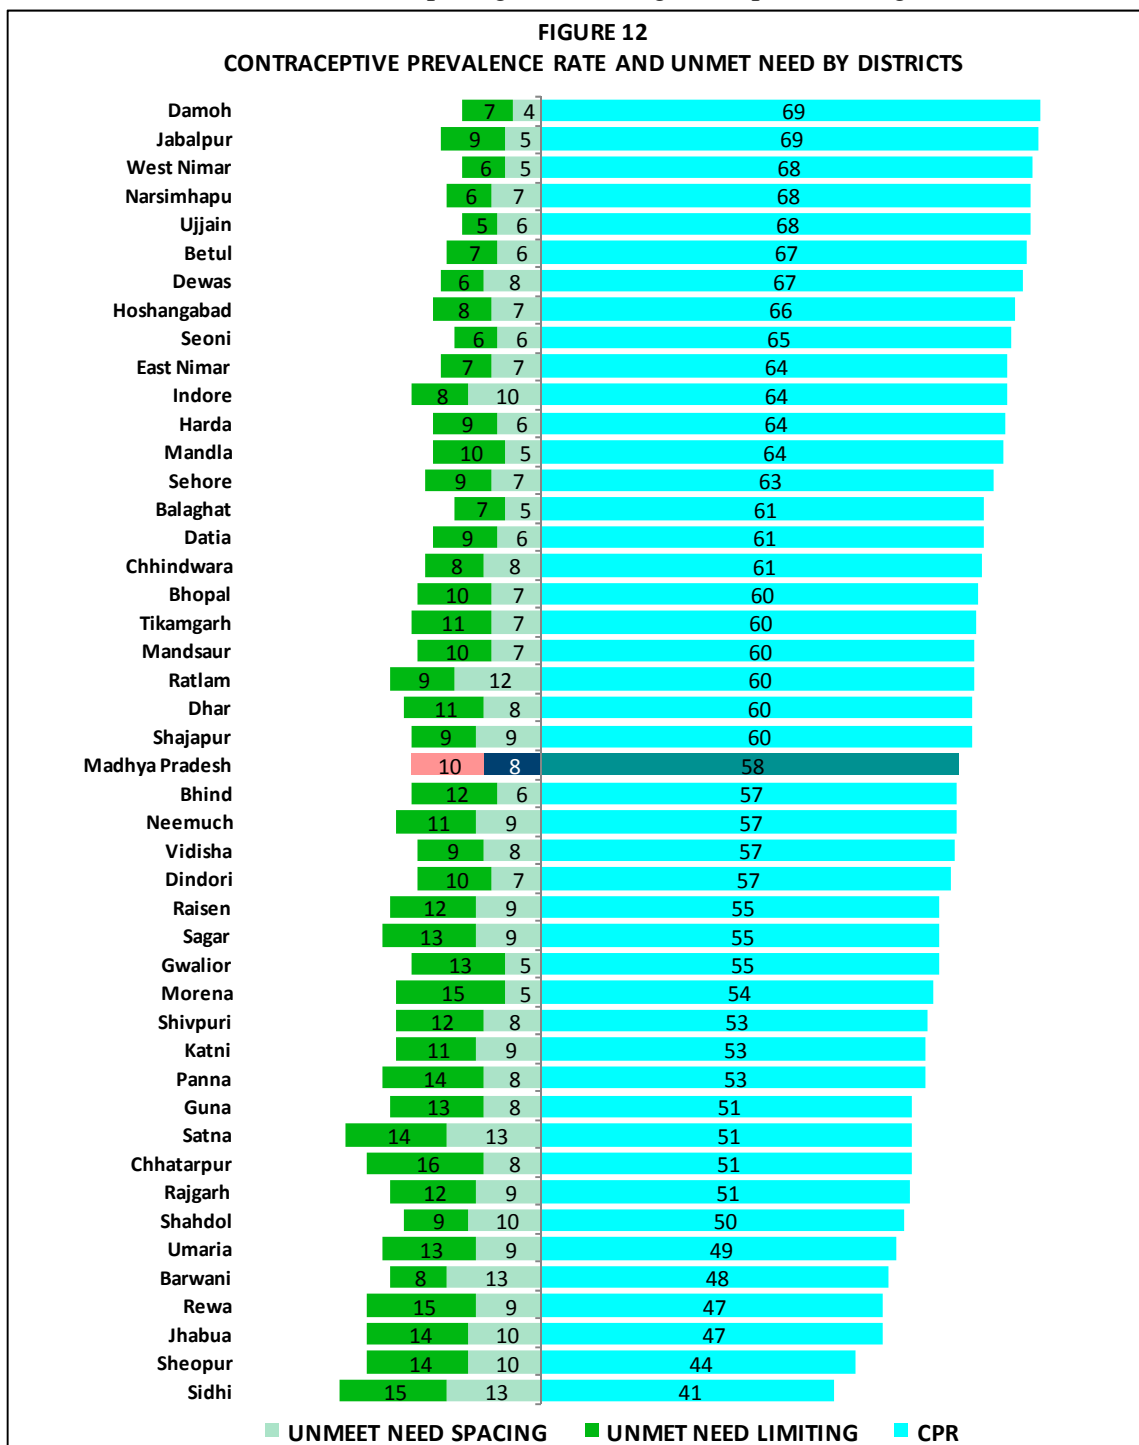

Unmet Need for Contraception

The total unmet need for contraception either for spacing or limiting is 18.1 percent. Currently married women physiologically fertile for conceiving and who want more children after two or more years are considered to have unmet need of contraceptive for spacing. The Unmet need for contraception during DLHS-2 to DLHS-3 has decreased from 21 percent to 18 percent as shown in the Fig. 11. In Madhya Pradesh, 7.8 and 10.3 percent of currently married women have unmet need for spacing and limiting respectively (Table 6.15). Unmet need for spacing is 29.3 percent for women with one living child and in the range of 21.0-25.3 percents for women under 25 years.

Contraceptive Prevalence Rate and Unmet Need by Districts

Unmet need is 27.7 percent in Sidhi, the highest amongst the districts and the unmet need is 11.0 percent in Damoh. Currently married women with unmet need for spacing in Jabalpur and Mandla are around 5 percent respectively while it is ranges from 11.8-13.2 percent in Satna, Shahdol, Sidhi, Ratlam and Barwani (Table 6.16). District-wise distribution of contraceptive prevalence rate and unmet need for spacing and limiting are depicted in Fig.12.

On the other hand, currently married women who are still physiologically fertile for conceiving and want no more children are categorized as having unmet need for limiting. The unmet need of contraceptive for limiting is highest at 15.6 percent in Chhatapur and 5.2 percent (the lowest) in Ujjain (Table 6.16). It can be noted that unmet need for contraception is low for districts with higher contraceptive prevalence rates.

REPRODUCTIVE HEALTH AND AWARENESS OF RTIs/STIs AND HIV/AIDS

RTIs/STIs

An integrated agenda of NRHM is to promote awareness and knowledge on RTIs/STIs and HIV/AIDS and to make health facilities accessible for checking and treatment seeking to ensure healthy sexual life, free from fatal infection. One of the responsibilities of health personnel is to provide correct knowledge of reproductive tract infection (RTI)/sexually transmitted infection (STI), HIV/AIDS and to encourage checking and treatment.

Among ever married women between 15-49 years, 27.4 percent have experienced one or the other menstruation related problems; largely painful periods (77.5 percent) high among women in the young age group, rural residents, newly married, non-literate to low educational level, scheduled tribe and women belonging from poorest households. Prolonged bleeding (11.7 percent), frequent or short periods (11.6 percent), blood clots/excessive bleeding (7.2 percent), scanty bleeding (10.6 percent) are invariant with the residence, educational level of the women (Table 7.1). Seventeen percent of ever married women have heard about RTIs/STIs and it is more often heard by urban women (29.4 percent), recently married (marital duration 0-4 months) women (18.5 percent), women with more than 10 years education (45.9 percent) and women married to more educated husbands (29.5 percent) than women living in rural areas (12.7 percent), non-literate (8.8 percent) and those married to non-literate husbands (8.1 percent) (Table 7.2) and also shown in Fig. 13. Women have heard about RTIs/STIs from multiple sources, 53.8,

44.9, 24.6, 16.8 and 15.0 percent from television (TV), relatives/friends, radio, print media, and health personnel respectively, but only 1.4 percent from school/adult education programmes (Table 7.2). Among those who have heard about RTIs/STIs, 59.2, 39.1, 30.0, 28.7, 19.9 and 17.8 percents have reported unsafe sex with persons who have many partners, unsafe delivery, unsafe sex with sex worker, unsafe abortion, unsafe sex with homosexuals, unsafe IUD insertion, respectively as the reasons for transmission of RTIs/STIs (Table 7.3). The knowledge about

transmission varies by residence, marital duration and educational attainment in favour of recently married and more educated urban women.

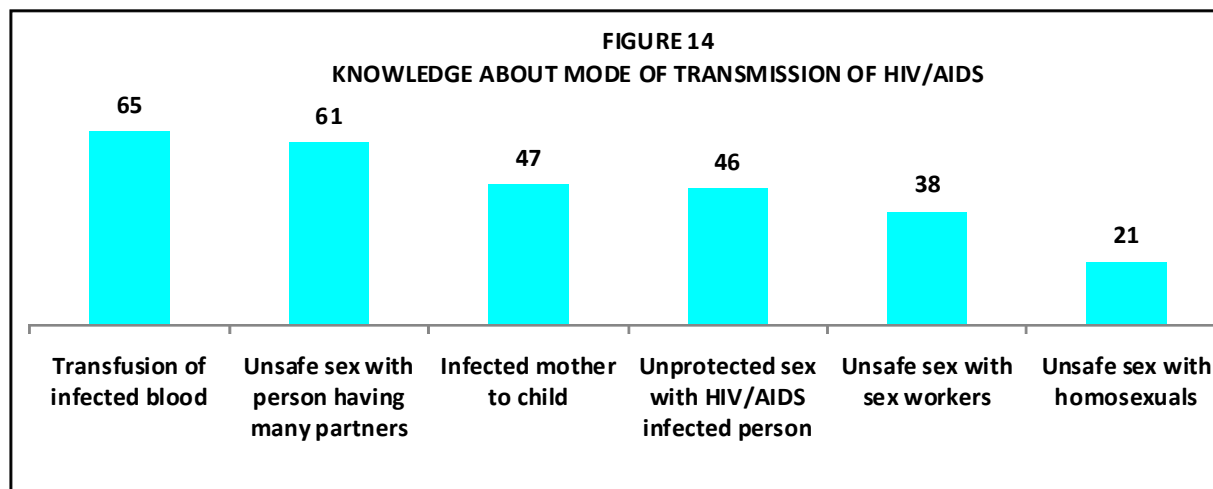

One-quarter (25 percent) of ever married women between 15-49 years reported to have experienced abnormal vaginal discharge and 26.5 percent reported having symptoms of RTIs/STIs. Among the women who had any RTIs/STIs symptoms the prevalence of RTIs/STIs symptoms ranges from 8.9-0.7 percents, pain in lower abdomen not related to period, spotting after sexual intercourse (Table 7.4). Most of the women (74.9 percent) discussed RTIs/STIs related problems with their husbands and among the women having RTIs/STIs symptoms, 30.3 percent have taken treatment, mainly from private doctors (58.4 percent) and also from a government health facility (37.6 percent) (Table 7.5).

Rajgarh and Betul are the two extreme districts as far as ever married women who have heard about RTIs/STIs are concerned, with 5.0 and 44.3 percents having heard of it (Table 7.6). In the districts of Tikamgarh, Indore, Chhatarpur and Harda 30.1-41.8 percent of ever married women have heard about RTIs/STIs. Women who have reported having abnormal vaginal discharge and any symptom of RTIs/STIs in Balaghat are 8.5 and 15.6 percents respectively and in Sehore district, it is 40.4 and 37.1 percent respectively. In Chhatarpur, Datia, Tikamgarh, Shivpuri, Sheopur, Guna and Sidhi 10.5- 18.5 percent women sought for treatment for any RTIs/STIs and in Balaghat, Narsimhapur, Bhopal, Hoshangabad, Barwani and Indore 40.0-45.7 percent women sought treatment for the any symptoms of RTIs/STIs (Table 7.6).

HIV/AIDS

Among the ever married women between 15-49 years, 32.0 percent have heard of HIV/AIDS and the source of HIV/AIDS information is mostly from TV (83.5 percent), Radio (40.3 percent), relatives/friends (24.1 percent), and print media (19.7 percent). About 11 percent have heard about it from their husbands and from health personnel. Unlike in the case of RTIs/STIs, school/adult education program (1.9 percent) and leaders/community meeting (3.6 percent) are not a rich source of knowledge for HIV/AIDS (Table 7.7). The main mode of transmission of HIV/AIDS reported by women are transfusion of infected blood (64.8 percent), unsafe sex with person having multiple partners (60.8 percent), mother to child (46.8 percent), unprotected sex with an HIV/AIDS infected person (45.7 percent), unsafe sex with sex worker (38.0 percent) and unsafe sex with homosexuals (21.2 percent) (Table 7.8). This is presented in Fig.14. The knowledge regarding the mode of transmission of HIV/AIDS is high among women with more than 10 years of education and women from the richest households (Table 7.8). In Dindori district women have least heard about HIV/AIDS (11.2 percent) and most women (72.5 percent) in Bhopal have heard of HIV/AIDS (Table 7.13).

At the state level only 46.8 percent of women have the right knowledge regarding the possibility of transmission of HIV/AIDS from mother to child. Out of the 45 districts of Madhya Pradesh, only in eleven districts, namely West Nimar, Jabalpur, Neemuch, Barwani, Sidhi, Sheopur, Raisen, Satna, Chhindwara, Ujjain and Bhopal, more than half of women (50.2 - 64.7 percent) have this correct knowledge and just one-quarter (24.8 percent) of women in Shivpuri know that HIV/AIDS can be transmitted from mother to her child (Table 7.13).

Among women who have heard of HIV/AIDS and reported that transmission of HIV/AIDS can be prevented by having sex with one partner or avoiding sex with homosexuals constitute 56.9 percent, safe blood transmission or avoiding sex with persons who inject drugs comprises of 52.9 percent and using condom correctly in each sexual act makes up 47.9 percent (Table 7.9). The right knowledge that HIV/AIDS transmission can be prevented by using condom is least in Panna (18.7 percent) and highest in Guna (70.1 percent) (Table 7.13).

The most common misconception about transmission of HIV/AIDS among the ever married women is that one can get HIV/AIDS from mosquito, flea or bug bites as reported by 12.6 percent of them (Table 7.10). This misconception is more among younger women, rural residents, and non-literate women. The proportion of women who have the misconception that HIV/AIDS can be transmitted by shaking hand and hugging, sharing clothes, sharing food and stepping on others urine/stool are 5.9, 7.5, 9.1 and 7.9 percent respectively (Table 7.10). Regardless of background characteristics, more than half of ever married women (52 percent) know the place where HIV/AIDS can be tested (Table 7.11). More than 60 percent of women in Tikamgarh, Panna, Shahdol, Chhindwara, Ujjain, East Nimar, Sagar, Katni, Mandla, Narsimhapur and Chhatarpur know the place for testing and 22.7- 39.1 percent of women in Guna, Dewas, Shivpuri, Morena, Dhar, Indore, Datia, Ratlam and Damoh are aware of the same (Table 7.13). Most women (66.6 percent) reported HIV/AIDS test can be done in a government hospital/dispensary followed by 22.2 percent reporting private hospital/clinic as the place for testing HIV/AIDS (Table 7.11). Just about 1.9 percent of ever married women have undergone HIV/AIDS test, among them 51.8 percent have done it more than a year ago and 48.2 percent in the last one year period (Table 7.12).

INFERTILITY AND CHILDLESSNESS

Seven percent of ever married women age 15-49 years in Madhya Pradesh have infertility problem, and among them 5.1 and 1.8 percent had primary and secondary infertility respectively (Table 7.14). A sizeable 72.8 percent of ever married women reported to have experienced problems in conceiving for the first time, 12.1 percent had problems conceiving after still/live birth and 6.4 percent after undergoing induced abortion (Table 7.14). More than 40 percent of

women in Umaria and Sagar have menstruation problem, while more than 10 percent of ever married women in Shajapur, Neemuch, Narsimhapur, Hoshangabad, Umaria, Sehore and Indore have infertility problem including primary and secondary infertility. Infertility problem is the highest in Indore district (13.1 percent) and is the lowest in Dindori (3.3 percent) (Table 7.17).

About 3 percent of women between 20-49 years, who have been married for at least five years, are childless and 1.9 percent of women had problems in conceiving. However, it is observed that the prevalence of childlessness is more among women in rural areas (3 percent), 18 years and above consummation of marriage (3.4 percent), 5-9 years of education (3.7 percent) and women from household in the second wealth quintile (3.1 percent) than their counterparts in the urban areas (2.6 percent), below 18 years of consummation of marriage (2.7 percent), non-literate women (2.5 percent) and women from the household in fourth and highest wealth quintile (2.7 percent). Women who have problem in conceiving are invariant with the background character. Among the ever married women between 40-49 years, 1.3 percent of them are childless and among them 1.1 percent have problems in conceiving in the absence of contraception (Table 7.15).

Among ever married women who have primary infertility problem 75.4 percent and 71.9 percent for secondary sterility have taken treatment (Table 7.16). Treatment seeking behaviour varies with age of the women, residence, consummation of marriage, marital duration, educational status of women and her husband, caste/tribe, and wealth status of the household. More than 90 percent woman who has an infertility problem has taken treatment in Ujjain, East Nimar, Ratlam and Bhopal (Table 7.17).

FAMILY LIFE EDUCATION AMONG UNMARRIED WOMEN

The objective of family life education is providing knowledge about the physiological features of women as they grow up and make them understand the norms of marriage and reproductive health of women. In DLHS-3 knowledge and source of information about RTIs/STIs, HIV/AIDS, Family Planning, Family Life Education, Marriage and Reproductive Health were collected from unmarried women aged 15-24 years.

In all 9,940 unmarried women were interviewed in Madhya Pradesh, of which 84.1 percent were between 15-19 years and the remaining 15.9 percent were between 20-24 years. In rural areas unmarried women in the later age group constitute 10.1 percent as against 26.9 percent in urban areas. More than half (63.6 percent) of the unmarried women in rural areas had 5-9 years of education and among urban unmarried women 49.7 percent had more than 10 years of education (Table 8.1). Around two-fifths (39.1 percent and 43.9 percent) of the rural and urban unmarried women between 15-24 years belong to other backward classes. In urban areas more than half (54.6 percent) unmarried women were from richest households.

Sixty percent of the unmarried women were aware of Family Life Education and awareness among women age 15-19 years, rural residents, lower level of education, schedule caste/tribe and other backward classes, women belongs to middle top lowest wealth quintile are below the overall level of awareness (Table 8.2). There is a significant gap between the level of awareness and perception of importance of Family Life Education among the unmarried women in

Madhya Pradesh by selected background characteristics. The proportion of women, who were of the opinion that Family Life Education should be given by age 15-17 years is 40.8 percent. As many as 43.5 percent of unmarried women felt it is important to provide Family Life Education after reaching the tenth standard (Table 8.2).

As regards the opinion on ideal persons who should impart Family Life Education, 87.0 percent of unmarried women felt that parents should provide them with family life education, while 54.4 percent women were of the view that it should be provided by brother/sister/sister in law and 47.2 percent had the view that it should be provided by teacher/school/college (Table 8.3). Only 10.4 percent of unmarried women mentioned that healthcare provider/sex education experts were ideal to provide such education.

Little more than one-thirds (35.2 percent)

of the unmarried women in Madhya Pradesh had received Family Life Education. The main source of education is school/college (65.7 percent), followed by other sources (40.1 percent), while 8.4 percent from youth club, 6.8 percent from government programme/camp and 4.1 percent had received Family Life Education from a NGO programme/camp (Table 8.4).

It has been observed that around 9 in every 10 of unmarried women between 15-24 years have the knowledge of minimum legal age of marriage for boys and girls (87.0 percent for boys and 88.1 percent for girls) (Table 8.5). Around eight percent reported ideal age of marriage for boys as less than 21 years while the remaining 91.7 percent reported more than 21 years. On the other hand, almost all women in the age group of 15-24 years reported the ideal age of marriage for girls is 18 years and above.

REPRODUCTIVE HEALTH AND AWARENESS OF CONTRACEPTIVES, RTIs/STIs AND HIV/AIDS AMONG UNMARRIED WOMEN

In DLHS-3, the status of menstruation and menstruation related problems experienced by unmarried women in the three months preceding the survey were collected. About three out of every ten women (29.6 percent) had menstruation related problems during the last three months preceding the survey (Table 8.6). Eighty-nine percent of the unmarried women had painful periods while 10.7 percent had irregular periods. Some women had problems like prolonged bleeding (8.9 percent).

The practices followed during menstruation period are important from the consideration of RTI and personal hygiene. Currently menstruating women were asked about the practices followed during the menstrual period. Almost all women (90.0 percent) of the currently menstruating unmarried women used cloths while 9.4 percent use sanitary napkins and 7.7 percent used locally prepared napkins (Table 8.7).

Education on contraceptive means and methods is an integral component of Family Life Education besides the knowledge acquired from exposure to mass media. It is imperative to assess the knowledge of contraceptive means and methods among unmarried women. About 71.2 percent of unmarried women between 15-24 years had the knowledge of male sterilization and 88.4 percent had knowledge of female sterilization (Table 8.8). Regarding spacing methods, 71.1 percent had knowledge of pills, 53.1 percent had knowledge of condom/*nirodh* and 38.7 percent had knowledge of IUD. Little more than one-fourth of unmarried women had knowledge of emergency contraception and about two-fifths have knowledge about injectables (25.6 and 39.9 percents respectively). Information was sought from the sampled unmarried women about the places from where one can get pills and condoms. About two-thirds (62.1 percent) women were of the opinion that pills and condoms can be obtained from government health facilities and another 39.6 percent said it can be had from private facility too (Table 8.9).

The unmarried women were further asked about their involvement in discussion on family planning. It has been found that 16.3 percent women had ever discussed about family planning with anyone. More than one-fourths (27.7 percent) had discussed with parents, 49.8 percent had discussed with brother/sister/sister-in-law, 73.3 percent with friends/peers, and more than 8.2 percent had discussed with teacher/school/college (Table 8.10).

About one-fifths (19.3 percent) of unmarried women had heard of RTIs/STIs (Table 8.11). Majority (68.3 percent) of unmarried women know about RTIs/STIs from television, 39 percent know about RTIs/STIs from newspaper/books/magazines, about one-third know about RTIs/STIs from radio, 31.7 percent knew about RTIs/STIs from relatives/friends. Another 22 percent among unmarried women reported that they knew about RTIs/STIs from adult education programme/school teachers. The other sources of information are cinema, health personnel, partner, and religious/political leader/community meetings/exhibition/*mela* (Table 8.11).

About two-thirds (64.6 percent) of women mentioned that RTIs/STIs can be transmitted through unsafe sex with persons who have many partners, around one-fourth (24.6 percent) were of the opinion that it can be transmitted through unsafe sex with homosexuals. The proportions of unmarried women were of the view that RTIs/STIs can be transmitted through unsafe delivery; unsafe abortion and unsafe IUD insertion are 33, 25.5 and 14.2 percent respectively (Table 8.12).

More than 60 percent of unmarried women had ever heard of HIV/AIDS (Table 8.13). More than four-fifths (82.8 percent) of women knew about HIV/AIDS from TV, 42 percent from radio, 41.1 percent from newspaper books/magazines, while 9.1, 7.7 and 1.3 percent from cinema, health personnel and adult education programme. Among them about 74.5 percent said that HIV/AIDS can be transmitted through transfusion of blood, 54.7 percent said through unsafe sex with persons who have many partners, 53.1 percent said from infected mother to child, 44.3 percent said through unprotected sex with HIV/AIDS infected person (Table 8.14). Around one-

third were of the opinion that it can be transmitted through unsafe sex with sex workers and 20.1 percent said through unsafe sex with homosexual.

There are many misconceptions about transmission of HIV/AIDS. Thirteen percent of unmarried women were of the view that one can get HIV/AIDS by mosquito/flea or bedbug bites, 6.7- 8.8 percent were of view that one can get HIV/AIDS by stepping on urine/stools of someone who has AIDS, by sharing food with them or by kissing or hugging (Table 8.15). These women were further asked about how to avoid or reduce the chances of getting HIV/AIDS. More than half of the women (58.3 percent) feel that it can be avoided by limiting sex with one who injects drugs, 46.8 percent feel they could avoid by limiting the number of sexual partners and avoid sex with sex workers, 40.3 percent feel that the correct use of condom during each sexual act many reduce chance of infecting HIV/AIDS (Table 8.16). About one-thirds (30.5 percent) of women said avoidance of pregnancy when having HIV/AIDS and 26.6 percent feel abstaining from sex may also reduce the chances of infection of HIV/AIDS (Table 8.16).

In Madhya Pradesh 58.2 percent of women were aware of the place where HIV/AIDS could be tested (Table 8.17). They knew that it can be done at government/private hospitals, CHC/PHC/Sub-Centre and VCTC/ICTC clinics. Unmarried women knew that it was possible to know the sex of the baby before the baby was born by a medical test (Table 8.18). They also knew that pregnancy cannot occur after kissing or hugging. While more than one-fourth women knew that it can occur when a women has intercourse. One in every nine women (11.8 percent) were of the opinion that a woman was most likely to get pregnant if she had sexual intercourse half way between her periods.

HEALTH FACILITIES - AVAILABILITY AND QUALITY

Health Facility Survey is a companion survey of the household survey in DLHS-3. It includes Sub-Centres, Primary Health Centres (PHC) and Community Health Centres (CHC) which cater to the RCH services of sampled villages. The basic objective of facility survey is to collect data on health personnel, availability of drugs/medicines, equipments, basic RCH care amenities, communication means and infrastructures at the level of Sub-Centre, PHC and CHC, in order to assess the adequacy of RCH services in rural areas. The average sampled rural population served per Sub-Centre, PHC and CHC in Madhya Pradesh are 5,912; 43,390; and 149,413 respectively (Table 9.1). In all 1,718 villages were surveyed in DLHS-3 and the RCH services of these sampled villages were catered by 1,362 Sub-Centres, 476 PHCs and 259 CHCs (Table 9.2 through Table 9.10).

One-fourths (25.6 percent) of sampled villages have Sub-Centre within the villages, while the corresponding proportion is 14.6 and 42.9 percent in Damoh and Dhar respectively (Table 9.2). More than 90 percent of sampled Sub-Centre have an ANM/Female Health Worker (FHW) in position and 63.9 percent of sampled Sub-Centre had an ANM/FHW residing in Sub-Centre quarter. Out of sampled 35 Sub-Centres in Bhind which have ANMs in position, only 13.6 percent of the ANMs reside in Sub-Centre quarter while in all sampled Sub-Centres, of Shajapur, Indore, East Nimar, and Harda ANMs stay in Sub-Centre quarter. Out of the 757 sampled Sub-Centres in public building only 49 (6.5 percent) Sub-Centres have regular electricity. In Bhind, Jhabua, Morena, Seoni and West Nimar the regular electricity connections ranges from 4.3-5.3

percents and it is 46.2 percent in Katni. In 420 (55.5 percent) of the Sub-Centres located in government buildings have labour rooms and out of this only 60 (14.3 percent) of the labour rooms are currently in use (Table 9.3). In the sampled Sub-Centres of Dindori there was no labour room. There is toilet facility in 554 (73.2 percent) of the sampled Sub-Centres located in public buildings and more than two-thirds (66.7 percent) of Sub-Centres house in government buildings have provision for water.

In order to assess the adequacy of the equipments in the sampled Sub-Centres, the Sub-Centres having 60 percent of essential equipments for RCH services are categorized as adequately equipped, otherwise inadequately equipped. A similar categorization of Sub-Centres having adequate stock of essential drugs for RCH services is followed. Distribution of adequately equipped Sub-Centres and Sub-Centres having adequate stock of essential drugs by districts are shown in Table 9.4. It is being noted that 1259 (92.4 percent) of the sampled Sub-Centres in Madhya Pradesh are adequately equipped and in the districts of Datia, Neemuch, Ratlam, Rajgarh, Vidisha, Bhopal, Betul, Jabalpur and Mandla, hundred percent adequacy of equipments in the sampled Sub-Centres were observed. On the other hand, 1275 (93.7 percent) of the sampled Sub-Centres have adequate stock/supply of essential drugs for RCH services except in nine districts of Tikamgarh, Katni, Damoh, Bhind, Rajgarh, West Nimar, Panna, Harda and Sheopur where the sampled Sub-Centres have 71.9 - 89.7 percent adequacy of essential drugs. Citizen's charter is displayed in 40 percent of the sampled 545 Sub-Centres (Table 9.5). The proportion of sampled Sub-Centres facilitated by Village Health & Sanitation Committee (VHSC) and those that received untied funds is 78.8 and 86.8 percent respectively.

There are PHCs serving 8-19 sampled villages in Bhopal, Indore, Gwalior, Jabalpur and East Nimar (Table 9.6). There is no Lady Medical Officer (LMO) in the sampled PHC from Sheopur, Shivpuri, Damoh, Umariya, Sidhi, Mandsaur, Ujjain, Rajgarh, Sehore, Betul, Hoshangabad, Katni, Narsimhapur, Dindori and Balaghat (Table 9.6). There are LMOs in position in 64 (13.5 percent) of the 476 sampled PHCs, Medical Officers (MO) in position in 314 (66 percent) in the sampled PHCs, only 40 (8.4 percent) PHCs there are AYUSH doctor in position and 153 (32.1 percent) Pharmacist are in position of the sampled PHCs.

About two-thirds (63.5 percent) of the 476 sampled PHCs have residential quarters available for MO (Table 9.7). Among the 476 sampled PHCs 347, (73 percent) PHCs were functioning 24 hours. More than two-thirds (66.6 percent) of the sampled PHCs catering to the sampled villages have at least 4 beds and such facilities are available in all the districts. In contrast to the condition of Sub-Centre, 97 (20.4 percent) sampled PHCs have regular power supply and only 138 (29 percent) have functional vehicles.

New born care equipments are available in 30 percent of the sampled PHCs, 78.4 percent have functional OTs and 67.7 percent provide referral services for delivery (Table 9.8). More than half (52.7 percent) of the PHCs in Madhya Pradesh have at least 60 percent of essential drugs and about half of the PHCs (49.4 percent) have at least 60 percent cold storage systems. More than four-fifths (82.1 percent) of the PHCs in all the districts have conducted at least 10 deliveries in the last one month. Untied funds have been utilized by 358 of the 475 sampled PHCs and all sampled PHCs in Sagar, Ratlam, Shajapur and Indore have utilized untied funds, Rogi Kalyan

Samiti (RKS) have been constituted in 432 (90.8 percent) of the sampled 476 PHCs and Citizen's Charter displayed in 265 (55.7 percent) of sampled PHCs.

The distribution of 259 sampled CHCs among the districts in Madhya Pradesh is uneven with Chhindwara having 13 of them and just 2 in Datia, Bhopal and Harda (Table 9.10). In Datia, Bhopal, Harda, Umaria, Raisen, Chhatarpur, Panna, Ratlam, West Nimar, Hoshangabad, Katni, Shivpuri, Tikamgarh, Damoh, Satna, Vidisha, Dindori, Seoni, Shajapur, East Nimar, Betul and Sidhi of the sampled CHCs serving the sampled villages have no gynaecologists in position and only in 41 (15.8 percent) CHCs have gynaecologists. The proportion of sampled CHCs which have a Paediatrician, Anaesthetist and Health Manager are 18.5, 10.4 and 9.3 percent respectively. In 10 districts of Madhya Pradesh of the sampled CHCs which provide RCH services to the sampled villages has blood storage facility (Table 9.11). For the state as a whole only 10 (6.3 percent) of the sampled 259 CHCs have blood storage facility. All the sampled CHCs in Morena, Guna and East Nimar to name a few, are designated FRUs and overall 61.4 percent of the sampled CHCs in Madhya Pradesh are designated FRUs. Out of the 259 sampled CHCs, 183 (70.7 percent), 137 (86.2 percent) and 131(50.6 percent) have functional OTs, new born care and low birth weight (LBW) management facilities (Table 9.11). Out of the sampled 259 CHCs, 96.9 percent of sampled CHCs, RKS has been constituted and 97.6 percent of the constituted RKS are monitored regularly (Table 9.12).

**RESPONSE RATES AND DEMOGRAPHIC
INDICATORS**

TABLE 1.1 NUMBER OF HOUSEHOLDS, EVER-MARRIED WOMEN & UNMARRIED WOMEN INTERVIEWED

Number of households, ever-married women and unmarried women interviewed by district, Madhya Pradesh, 2007-08
