HUMAN DEVELOPMENT REPORT
2002

USING THE POWER OF DEMOCRACY
FOR DEVELOPMENT

“The service of India means the ending of poverty and ignorance and disease and inequality of opportunity ”

Jawaharlal Nehru defining the challenge of a newly independent India, 1947

BEN OKRI
Mental Fight: An anti-spell for
the twenty-first century

Is time exhausted?

No, time is yet young,
And has timeless millennia ahead,
Way beyond our furthest dreams

Is nature exhausted?

Ask the oak-trees, the hollies,
The flowers, birds, fishes, and lions.
They will continue for as long
As the earth allows them.

Is humanity exhausted?

Individuals are, nations are,
Some civilisations are becoming so;
But humanity isn't.

The hungry nations are hungry still.
The starving people dream of food.
The unfree fight for freedom
The oppressed plan for liberation.
The small scheme for might.
The invisible prepare for higher visibility.

They are only exhausted
Who think they are
They are only exhausted who no longer
Have a reason to strive
And dream and hope

Those who are exhausted have lost
The greater picture,
The greater perspective.
They are trapped in their own labyrinth,
Their lovelessness, selfishness,
I hear them talk about the end
Of history.
But for those of us who haven't yet tasted
The best fruits of time yet,
To whom history has been harsh,
We think differently.
We know that history is all there to be made in the future.

There is no exhaustion where there is much
To be hoped for, much to work towards,
And where the dreams and sufferings
Of our ancestors
Have not been realised,
Or redeemed.

But when you can no longer dream
No longer see possibilities
No longer see alternatives;
When you see only limitation
Only despair, and negation,
Then you are in the way
You are also the problem
The exhausted obstruct
The creation of a greater future.

The exhausted should therefore clear
The stage for new dreamers-
For warriors of love, justice
And enlightenment

Foreword

This is the Third Human Development Report of Madhya Pradesh. While introducing the two earlier reports we have mentioned the reasons that prompted us to prepare Human Development Reports. The first Report in 1995 was, like we mentioned, a report on our failures, on what remained to be done. In that sense it benchmarked our status on human development indicators and shared concern and urgency. Looking back, the Report served its purpose. It served to mobilise public opinion towards the new agenda we had adopted of according the highest priority to human development goals, working on some of them as Missions and working on them through a model of collective action made possible by Panchayat Raj.

Our second Report in 1998 acknowledged that governments do not have the luxury of merely documenting status in human development but instead are voted to office to make change in the human development situation. It could not be a passive record of statistics and comparative profiling. Therefore we reported on our efforts or the road covered and focussed as much on agency as on tasks.

Both Reports had one limitation in that often we were forced to rely on statistics of Census 1991, which by the time of the second Report of 1998 was indeed outdated. This Third Report has the advantage that at least some of the results of Census 2001 have been made public. This in fact prompted us to postpone our Report to 2002 instead of 2001 which ought to have been our deadline to keep to our three-year frequency.

It must be stated here that while the preparation

of Human Development Report was certainly inspired by the pioneering work of UNDP under the leadership of late Mahbub-ul-Haq, our Reports have been home grown efforts, undertaken entirely on our own volition and with our own funds, people and limitations. We have felt that this ownership is important so that the Reports lead to action.

I must acknowledge here Dr. Manmohan Singh who encouraged us to continue on this path when we broke new ground with the first sub-national Human Development Report which he released in 1995. Our first Report led to UNDP organising a national seminar at Bhopal coordinated by Professor Richard Jolly to persuade other state governments to prepare similar reports. We take some pride in the fact that the idea did indeed spread and several state governments have since produced similar state-level Human Development Reports. The Government of India has also produced a national HDR in 2001.

Professor Amartya Sen whose writing has been an inspiration for our work released our Second Human Development Report. We had made a commitment to him on that occasion that by the time our third Report is due, we would have universalised access to elementary education. We are happy to report that we universalised access to primary education in 1998 and have almost universalised access to elementary education. To ensure quality, we have become the first state in India to enact a People's Education Act which seeks to create a legal safeguard for quality. Quality for elementary education would no more remain an issue that agitates only the academic but a user issue that

involves learners, parents, local bodies, elected representatives at several levels, state legislature, teachers and academic institutions. We have legally ensured the preparation and publication of Public Education Reports and their submission to the State legislature each year.

We are aware that in the area of health we need to strengthen our efforts. We feel that here too the answer too lies in decentralisation to the district and below district levels for management. We must also build health action from below by mobilising the local community. Management of health institutions must be brought under community control. We have made some significant beginnings in the area of decentralisation through our Mission for Community Health and for management of hospitals through *Rogi Kalyan Samitis*.

Livelihood security for the poor is our most important challenge. We have been trying to address this issue through a variety of programmes for creating entitlements and enhancing opportunities. We feel that resources under programmes of the Government of India especially in the areas of anti-poverty programmes and food subsidies must be better targeted to vulnerable areas and vulnerable sections of our people. Macro economic policy must focus on employment creation as a clear objective in itself.

This Third Human Development Report registers the progress we have made on the human development agenda. Here again we report on action and how we have sought to use the power of democracy for development. We also present some of the constraints faced by the states like Madhya Pradesh in realising a human development vision in the current macro-economic

context. Human development goals cannot be pursued in isolation of these larger factors which sub-national governments are today unable to influence.

In this Report we also present the need to develop indicators of measurement that are relevant to our context. To the professionals guiding the development of HDI and related indices, we would like to suggest that disparities in India have not merely a class or gender dimension but also a caste/tribe dimension. It is time we develop in India, like the UNDP did the Gender Development Index in 1995, a Scheduled Tribe- Scheduled Caste Development Index to capture the inequality in opportunities to human development faced by the people belonging to the scheduled castes and scheduled tribes in India.

A Human Development Report produced in India cannot be indifferent to the stratification on the basis of caste and the glass ceilings that exist even with our commitment to equality before law and programmes for affirmative action. Similarly the growing alienation of tribal communities on account of the statisation of their resource base of forests and minerals has a negative impact on reducing human poverty of these groups. This can be resolved through imaginative policies at the national level that combine the objectives of natural resources conservation and development. Policies that build on such arguments can be initiated or reinforced through the creation of a Scheduled Tribe — Scheduled Caste Development Index. This will be the effort in our next Report.

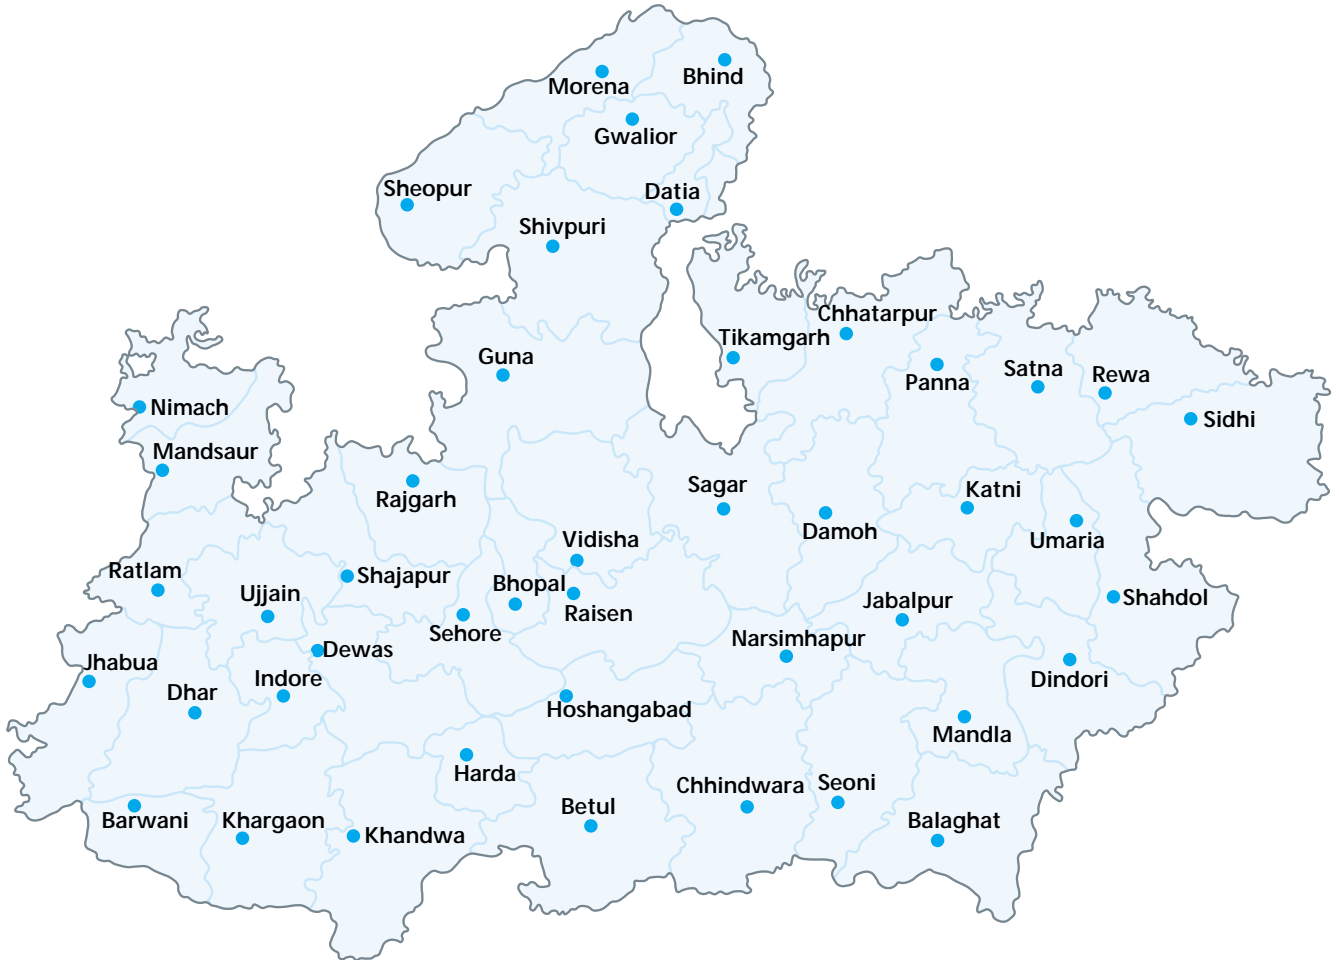

Digvijay Singh

Chief Minister, Madhya Pradesh

1 November 2002

Madhya Pradesh

Acknowledgements

The Madhya Pradesh Human Development report has been prepared by a team comprising of Shri Dilip Raj Singh Chaudhary, and Shri R. Gopalakrishnan from the Government of Madhya Pradesh, and personnel of ‘Sanket’, an independent multi-disciplinary research group based in New Delhi, Raipur and Bhopal. The ‘Sanket’ Project Team consisted of Sandeep Dikshit, Puja Gour, Madhura Chaphekar, Manish Shankar, Sanjay Shrivastava, and Sweta Verma assisted by Maheen Mirza, Monika Banerjie and Dinesh Sinha. Management assistance to the project was given by Shri Sultan Ahmad of the Directorate of Institutional Finance.

The third Madhya Pradesh Human Development Report has benefited from many individuals and institutions.

Members of the Empowered Committee of the State Government, chaired by the Chief Secretary Shri A V Singh encouraged academic freedom for the report.

Special mention needs to be made of Shri KSRVS Challam, Economic Advisor, Shri Manohar Agnani, Project Director, Health and Shri P D Joshi, Director Economics and Statistics, Government of Madhya Pradesh.

The Hindi translations of this report were undertaken by Shri Manohar Notani, Dr Sushil Joshi, Dr Suresh Mishra, Shri Parihar, Sushri Shashi Sablok, Sushri Rama Rao, Shri Raghvendra Kumar and Shri Anil Kumar Singh. Mr Pradeep Saha has designed the report and the printing has been done through Madhya Pradesh Madhyam.

Advisory Group

Dr Vijas S Vyas, Prof. Suresh Tendulkar, Dr Vinod Vyasalu, Dr NJ Kurien, Dr K Seetha Prabhu, Dr R Sudershan, Dr Rajan Katoch, Dr Ravi Narayan, Mr Sanjay Kaul, Dr R Govinda, Mr Ram Sharan Joshi, Ms Anjali Noronha, Shri P Sainath and Dr Suraj Kumar.

OUR PRINCIPAL CONTRIBUTORS

The report has drawn on the expert background papers of Shri R Gopalakrishnan for the chapter on Using the Power of Democracy for Development, Smt Amita Sharma for the chapter on education, and Shri Vijay Mahajan for the chapter on livelihoods. The health chapter was put together with inputs from Dr Ravi Narayan, Dr Abhay Shukla and Dr J S Vaseer. The chapter on widening regional disparities was drawn from a background paper by Dr Rajan Katoch, and the chapter on institutions on the background paper by Dr Vinod Vyasulu. Other papers used are on inter-region comparisons in Madhya Pradesh by Dr Rajan Katoch, on Panchayat Raj by Amitabh Singh and Leena Singh, on Gram Swaraj by Shri Shyam Bohre, and livelihood profiles of poor by Dr Pradeep Bose.

Using the Power of Democracy for Development: The Madhya Pradesh Effort

This chapter seeks to give an overview on the effort in Madhya Pradesh towards addressing goals of human development in the period from 1994 when the state went in for large-scale political decentralisation. It presents examples where the spaces created through decentralisation were utilised to advance action on human development goals. It explores the possibility of putting the architecture of decentralisation to work on human development goals to both consolidate grassroots democracy and move towards a rights-based framework for these goals. It underscores institutional reform in governance as the key enabling variable for accelerating achievement of goals. It sees this effort as having to operate within two major constraints. One constraint results from the macro-economic situation of the country which a sub-national entity like a provincial government is unable to influence. The other constraint relates to the continuing centralising tendency in planning for human development at the national level which state governments are continually forced to challenge if they are serious about achieving goals of human development quickly. Uneven development has always characterised the Indian situation. After the results of Census 2001 it is more than evident that problems of human development in India have increasingly become problems of selected Indian states, have characteristics that are not universally shared across Indian states and need responses that account for the specificity of those states. More than ever human development in India has become less of an “Indian” issue and more the issue of selected Indian states further vindicating the need to capture the human development situation of those relatively backward states through sub-national human development reports and document responses.

Putting political democracy back into poverty reduction and human development

Madhya Pradesh has been attempting to address the backlog of its challenges in human development through people seeing people as a strategic resource for action. The enabling framework of political democracy was itself seen as the biggest opportunity for doing this. Political decentralisation through

Panchayat Raj deepened democracy in the state. This was complemented by a widening of democracy through plural spaces for community action groups to work on specific agendas. The coming into being of these institutions was discussed in the Second Madhya Pradesh Human Development Report in 1998 which also discussed how the state was able to convert selected goals into Missions to be implemented through this new institutional arrangement.

A revitalised Panchayat and Urban local body system was brought into place in 1994 in Madhya Pradesh after the 73rd/74th Constitution Amendment. A second round of general elections was completed in 1999. The Panchayat Raj system was revamped by legally empowering the Gram Sabha through the Panchayat Raj and Gram Swaraj Act. Through Gram Swaraj opportunities for direct action by the community has increased through the Committees under it. Political supremacy of the Gram Sabha was reinforced through creating the provision of the Right to Recall in rural and urban local bodies, for the first time in India. Elections have been held for not only rural and urban local bodies, but also Cooperative Institutions, Agricultural Marketing Societies, Forest Produce Federations, Water Users Associations etc. In addition there are elected people’s representatives in bodies that that guide Watershed Management, Joint Forest Management, Management of Public Hospitals through Rogi Kalyan Samitis, Management of Colleges through College Management Committees etc. (*See Box Reducing the Democracy Deficit*)

A few examples —two from education, three from natural resources management and one from public health are being cited merely to illustrate potential of accelerating on human development goals through a framework of collective action enabled by political democracy.

- Madhya Pradesh was among the educationally backward states in India in the middle-nineties. The Government devised an Education Guarantee Scheme to provide a primary school to every community that demanded such a facility and had at least twenty-five children of the school-going age. If they did not have a school within one

Reducing the Democracy Deficit

In the last eight years multiple institutional spaces have been created in Madhya Pradesh for channelising action by the community. Elected representatives of Panchayat Raj, Gram Swaraj, Mandi (agricultural marketing societies) Samitis, and Cooperatives together with other user organisations have cumulatively contributed to enlarging democratic action. There has been a view that such plural organisations dissipate the core institution of panchayats but the experience in Madhya Pradesh has been that panchayats also work better in a contested environment and these organisations cumulatively create a democratic surplus.

- 3,44,424 elected representative of Panchayats, of whom 1,16,410 are women, have taken charge of their villages. The current set of representatives were elected in 1999 for a five-year term.
- Gram Swaraj has vested powers with gram sabha which acts through its committees consisting of elected representatives who were elected in 2001.
- 1,48,052 elected cooperative members work through 13,267 primary societies and their apex institutions. The latest round of elections were

in 2000-2001.

- 2280 elected representatives manage agricultural marketing societies and the recent round of elections were held in 2000.
- 50,000 members of watershed samitis, 15 lakh members of Tendupatta plucker societies and more than 48 lakh members of joint forest management committees have taken charge of managing their natural resources.
- 10,280 members of water user associations managing and allocating water in irrigation projects.
- 31,000 Gurujis teaching in community schools under Education Guarantee Scheme and 2,17,000 Guruji Volunteering to teach adult non-literates in Padhna Badhna Andolan.
- Rogi Kalyan Samitis manage 715 public hospitals of the states after mobilising Rs 500 million as community contribution.
- In all 51,086 villages a trained Dai and a Jan Swasthya Rakshak as community health activists by December 2002.

kilometre they could make a demand and the government guaranteed to meet that demand within 90 days. The community could also identify a local qualified resident to be the teacher. The scheme worked through a tripartite partnership between local community, local government and the state government with specific roles. The community raised the demand, identified the teacher and provided the space to run the school. The local body or panchayat supervised the school. The state government supported the local community through a grant to pay the teacher and ensured all academic inputs and quality of teaching and learning. The scheme which started on 1st January 1997 was able to provide a school to every habitation in the state by August 1998. 26,000 EGS schools came up in less than 20 months and Madhya Pradesh universalised access to primary education. Over a million children are enrolled in these community schools of which nearly fifty percent are girl children and ninety percent belong to scheduled castes, scheduled tribes and other backward castes. The Scheme went on to four other states and was adopted as a national model in 2000.

- A similar model was tried in adult literacy in the year 2000. People who were non-literate could come together as a Padhna Badhna Samiti and engage any literate person to be their teacher in a year-long campaign. Government provided the teaching-learning material. The Government also set in place an evaluation system. Based on the number of non-literate people who cleared the examination, the voluntary teacher would get a Gurudakshina as an honorarium at the rate of Rs 100 per person made literate. By providing an incentive-spine to the mass

literacy programme, over 2,17,000 Padhna Samitis came up in Madhya Pradesh and within one year these voluntary teachers, made 3 million people literate. This was reflected in the literacy rate in the Census of 2001. The literacy rate of Madhya Pradesh went up by an unprecedented 20% to catch up with the national average. Its male literacy at 76.6% is today above many states including Andhra Pradesh and Karnataka. Its female literacy rate went up by over 20% in the decade of the nineties and exceeded the cumulative growth of the three-preceding decades. These Padhna Badhna Samitis are getting repositioned as Self-Help Groups for economic activities and the Government another campaign for female literacy – a Mahila Padhna Badhna Andolan – has commenced. The volunteer teachers of the campaign are coming together as a network of a Padhna Badhna Sangh, with a local group for social action in each of the 51,086 villages of Madhya Pradesh and will manage a rural library in each village.

- In the area of natural resources management, by organising people through the Watershed Management Mission and a Joint Forest Management Programme, Madhya Pradesh has been able to arrest the degradation of land and provide incomes to the poor. In the Watershed Management Programme people come together as Watershed Management Committees to work on an agenda of creating community-level water security and improvement of land resources. The task was simple: to impound rain water which runs off into a series of water harvesting structures. The problem in our rural areas has been one of unemployment and inadequately developed land and

water resources. What the programme does is to bring them together and invest the surplus labour energy in a task of natural resources upgrading which in turn provides steady employment. The Watershed Management Mission which works in 7600 villages of the state on to improve 35 lakh hectares of land has evolved into a movement for water conservation across the state through a Pani Roko Abhiyan. This Pani Roko Abhiyan for community-led water harvesting has resulted in citizen action in private farms and community lands in an unprecedented manner. Between January 2001 when it started and now, over a million water harvesting structures ranging from tanks and farm ponds to simple Do-It-Yourself methods of channelising rain water to recharge dugwells showing the scale that is possible. Similarly through Joint Forest management, the management of forest is done through People's Committees. After Madhya Pradesh transitioned to such a model, the forest cover in the state as shown by satellite maps of 1999 increased by 635 square kilometres. 10,280 elected representatives of Water Users Associations manage irrigation systems in the state over 1.5 million members are involved through NTFP societies for management of Non Timber Forest Produce who collect the produce and retain the entire value from the operation.

- In the area of management of public hospitals Madhya Pradesh has gone in for Rogi Kalyan Samitis for their management. They are permitted to levy a modest user fee that can be retained at the hospital level to improve delivery of services. Today over 770 public hospitals are managed by such committees who have a saving of Rs 600 million with which they are improving services. Local management and autonomy is leading to improved public services provisioning. Madhya Pradesh is currently engaged in decentralising the management of its health systems to district and local levels and implement a model of community health action. This has several components starting from basics like training two community health activists in each village as a Jan Swasthya Rakshak (a barefoot doctor) and a trained Traditional birth attendant to strengthening rural health care and first-contact hospitals. The effort is to address the determinants of health like safe water supply, sanitation, nutrition and health education along with health action in inter-sectoral institutional arrangements like the Village Health Committees, Panchayats and District Governments brought into existence through political decentralisation. The decentralised framework if effectively utilised offers great opportunity for improving rural health care.

The simple point made by these examples is that when political democracy adopts decentralisation as its strategic architecture, solutions can be devised for seemingly formidable goals in unusual ways. Many of these challenges, if viewed aggregately, have a crisis-like dimension. Decentralisation

helps break them into small, manageable units and gets them done. For a large state like Madhya Pradesh political decentralisation becomes both a political imperative and sound managerial strategy. The challenge for political leadership has been one of sharing leadership. Through Panchayat Raj, Education Guarantee Scheme, Padhna Badhna Andolan, Watershed Management Mission, Joint Forest Management, Rogi Kalyan Samiti and similar such initiatives, an effort has been made to create a platform for several leaders to emerge to address these tasks in their local contexts.

Political Decentralisation and Mass Education

When Madhya Pradesh set about addressing its agenda of political decentralisation through Panchayat Raj and human development through the Rajiv Gandhi Missions in 1994 it was made clear that it sees mass education as the most important objective. Education is both an end in itself to realise the full potential of a human being and has instrumental value in making political democracy full-blooded. Eight years into that effort, by the time we measure its performance, Madhya Pradesh is seen to have moved closer to this goal. It has caught up with the national average in literacy thereby closing the historical gap. The next chapter of this Report discusses the growth in basic education and literacy in the state in detail.

A comparison of states which were similarly placed in the beginning of the decade would serve to illustrate the effort in MP and the so-called Bimaru states (Bihar, Madhya Pradesh, Rajasthan, Uttar Pradesh) would be a good indication of peer states. While all these states registered increase in literacy between the 1991 and 2001 Census Madhya Pradesh today among these states has the highest literacy rate at 64.1 while Rajasthan has 61%, Uttar Pradesh 57.4% and Bihar 47.5%. Given the fact that Chhattisgarh was carved out of Madhya Pradesh only in November 2000, and the work of the decade is being measured when Chhattisgarh was also part of Madhya Pradesh, the literacy rate further goes up marginally. Among the top ten districts of the country where the percentage of illiteracy reduced most in the decade, eight are from the erstwhile Madhya Pradesh (four of them are now in Chhattisgarh). Efforts at mass literacy complemented the effort at providing universal access to elementary education, goals that Madhya Pradesh has been pursuing in the nineties on a Mission-mode. Observers of the Indian economy who have drawn attention to increase in inequality between Indian states in the nineties (mainly between southern and western states on the one hand and the northern and eastern states on the other the latter already burdened with historical inequalities: Deaton and Dreze) cite Madhya Pradesh as a state where public action in the area of elementary education and literacy has resulted in social achievements.

The two graphs shown here show the closing gap between literacy rates of Madhya Pradesh and India over the last many decades. The pace at which this gap has closed has been the

Closing the Literacy Gap: Madhya Pradesh and India

Gap between Male and Female Literacy in Madhya Pradesh

achievements of the last decade only. The other graph exhibits the closing gap between male and female literacy. From 1961 to 1991, the gap between male and female literacy was continuously on the rise, but in the last decade for the first time, this gap reduced.

The increase in access to primary schooling in Madhya Pradesh leading to increase in enrolment is borne out by a comparison of the data of the two Lok Samark Abhiyan of 1996 and 2001. Lok Sampark Abhiyan or People's Data Base is an exercise carried out in Madhya Pradesh on a door-to-door basis through elected representatives in villages and teachers working as a team. This leads to the creation of a Village Education Register that becomes the unit for planning for education for all at the village level. It is seen that between 1996 and 2001, Gross Enrolment Ratio in the state went up from 76.5% to 96.2%. The Gross Enrolment Ratio of girls has increased from 70.7% to in 1996 to 94.3% in 2001. The Gross Enrolment Ratio of Scheduled Tribes has risen from 78% in 1996 to 91% in 2001. The percentage of out of school children reduced from 29.3% in 1996 to 11.2% in 2001. In other words while three out of ten children did not attend primary school in 1996 now it is only one out of ten. The gap in Gross Enrolment Ratio of boys and girls has also narrowed from 25% in 1992 to 11% in 1996 to 3.6% in 2001, a very positive sign.

In the area of health, Madhya Pradesh alone among the

“Bimaru” states has shown a declining trend in population growth, much of which can be attributed to the growth in literacy and education given the fact that health indicators per se have not improved dramatically in inter-state comparison. While population growth rate increased in Uttar Pradesh and Bihar and remained static in Rajasthan, Madhya Pradesh for the first time registered a declining trend. There is increasing cross-country evidence that political decentralisation which empowers women to move out from the private domain to the public domain thereby exercising a greater control on their environment can have a positive impact on population reduction.

In human development, the one sector where the state still faces a considerable challenge is health. Most of the major indicators are way below the national averages and stand amongst the lowest in India. On the other hand, there has been a small but significant shift in the progress level in health, and this is seen if we compare the last seven to eight years (1993 to 1999) of MP with the decade preceding that (1980 to 1992) (see Table 1).

Increased allocation to the Social Sector

During this period, Madhya Pradesh has sought to steadily increase its expenditure in the social sector. The chart below shows the increase in the social sector spending by Madhya Pradesh.

Table 1: Changes in Birth Rate, Death rate and IMR in Madhya Pradesh, 1993 to 1999

	Birth Rate		Death Rate		Infant Mortality Rate	
	MP	India	MP	India	MP	India
Change % age between 1980 and 1992	-6.3%	-14.0%	-17.8%	-22.8%	-36.5%	-44.3%
Change % age between 1993 and 1999	-13.7%	-10.0%	-18.9%	-13.4%	-16.5%	-5.7%

Source: Calculations made on data from Various Volumes of SRS, Registrar General of India.

State Expenditures on Social Sectors

During the year 1994-1995, the plan expenditure on social services was 23.64 % of the total plan expenditure. The plan expenditure on social services steadily rose in the remaining period of the Eighth Plan and throughout the period of the Ninth Plan (1997-2002). It became 27.15 % in 95-96, 32.34 % in 96-97, 33.14% in 97-98, 35.30 % in 98-99, and 38.77% in 99-2000.

The Table 2 shows increase in provisioning of amenities in terms of institutions in basic education, technical education and basic health in Madhya Pradesh in the period 1994-2001.

Acceleration of growth in Madhya Pradesh

Madhya Pradesh has been among the economically backward states of India. However in the decade of the nineties, Madhya Pradesh reversed this position and became one of the faster growing states of India and has sustained a high growth rate if the year of acute drought is excluded. Among the states in the north, Rajasthan and Madhya Pradesh have been seen as faster growing states but while Rajasthan has had this high growth since eighties, it is in the nineties that MP has begun to register this high growth rate. Seven states showed acceleration of growth in the nineties as reported in the Mid-Term Appraisal of Ninth Five Year Plan by the Planning Commission. To quote the Report “seven states showed an acceleration of growth in the 1990s. They are fairly well distributed regionally i.e. Gujarat (9.6%), Maharashtra (8.0%), West Bengal (6.9%),

Tamil Nadu (6.2%), Madhya Pradesh (6.2%), Rajasthan (5.9%) and Kerala (5.8%)”. Per Capita income has also grown over the period though at a slower rate on account of slow pace of population reduction. The per capita income of Madhya Pradesh, which was Rs 6577 in 93-94 has gone up to Rs 7088 in 96-97 and Rs 7947 by 1999-2000.

According to the National Human Development Report 2001, Headcount Ratio of rural poverty went down in Madhya Pradesh from 40.6 in 1993-1994 to 37.1 in 1999-2000. Headcount ratio of poverty in Urban areas during the same period went down from 48.4% to 38.4%. According to NHDR 2001 Madhya Pradesh, among the Bimaru states has the second highest HDI, (Rajasthan has the highest) at 0.328 while Uttar Pradesh is at 0.314 and Bihar at 0.308.

Moving towards a rights-based framework on human development goals

Madhya Pradesh became the first state in India to conceive a rights-based framework for basic education in India when it introduced the Education Guarantee Scheme in 1997. The understanding of rights in the Education Guarantee Scheme goes beyond seeing it as a civil right, a right of the citizen vis-à-vis the state or society but wraps within it the notion of social, economic and cultural rights. Education of the child is presented as a right that the state has to ensure working together with society and citizens. The debate between procedural rights and substantive rights is sought to be reconciled in a practical manner in the form of a state guarantee, which the state was able to ensure because the participation sought from society was forthcoming. Here again political decentralisation becomes the enabling framework.

In the area of basic education, the rights-based framework has been carried over into the area of ensuring quality for elementary education through the Madhya Pradesh Jan Shiksha Adhiniyam (Madhya Pradesh People’s Education Act, 2002). As the first Act of its kind it charts new territory. The Act holds providers in the public schooling system accountable for quality and for this Parent-Teacher Associations have been given legal space. The Act stipulates quarterly submission of academic records of children at the school level at the Parent-Teacher Association meetings and annual Public Education Reports to District Planning Committees (District Government) and the state legislature, which will organise information based on legislative constituencies. It is expected

Source: Mid Term Appraisal of the Ninth Five Year Plan: Planning Commission

that this Act will create an understanding of quality as much a user issue of learners, parents and local communities as providers of public schooling like the government and its academic agencies. Political decentralisation, which created the enabling framework for universalising access to schooling facility is being leveraged for improving quality.

In the area of health, Madhya Pradesh has initiated a few modest steps towards creating a Health Guarantee Scheme or more appropriately a Health Services Guarantee Scheme (Swasth Jeevan Sewa Guarantee Yojana). Here again political decentralisation provides the institutional arrangements to move from selective health care to comprehensive health care. The problems in the health sector need extra-sector action to be effective. Many key determinants of health like safe water supply, sanitation, nutrition and the like lie outside the sector. It is here that the multi-sector mandate that village, panchayat and district have received through political decentralisation helps the health sector to create collective intersectoral action for health outcomes. The effort is to back this at the district-level through provision of Community Health Action Fund and address gaps in the provision of services including determinant services. Two health activists who are volunteers from the community will animate the Village Health Society which is the nearest unit for such collective action.

Creating greater transparency and accountability in government

Promotion of measures that ensure accountability is integral to democracy. Panchayat Raj and decentralisation upset traditionally accepted patterns of bureaucratic governance and the challenge was to reorient accountability-structures from being upward to being outward. Since 1994 powers have been vested with gram sabha for social audit of actions by elected representatives and in 1999 the provision of Right to Recall was introduced for all local bodies. The Panchayat Raj Act was reformulated to give salience to the Gram Sabha through the Panchayat Raj evam Gram Swaraj Ahiniyam whereby elected representatives have been subordinated to the collectivity of the Gram Sabha. Citizen Charters are in place for all departments since 1999 and Public Service Agreements have been initiated for 6 major departments.

A week-long Gram Sampark Abhiyan and Nagar Sampark Abhiyan where every village in the state and every ward in a town is intensely covered for a reality check on development programmes initiated in 1997 has now become institutionalised. Every month in every village a 11-point programme on basic development inputs is monitored. It has been web-enabled and readers of this document can access basic information on every village in the state of Madhya Pradesh on www.mp.nic.in/gramsampark. A measure for transparency and accountability for community schools of the Education Guarantee Scheme through the internet has been used also as a way of creating a local-global partnership on a C2C model thereby leveraging an information technology tool of the internet to promote equity. Here citizens can choose these community schools for support on an internet site www.fundaschool.org which realises the notion of a global partnership for basic education. The Government of Madhya Pradesh sees this less as a fund-raising venture and makes it clear that these resources will not be substitutive but additive but sees it as valuable for creating a community of concern around basic education. An interactive public information website in Hindi and English called www.kisanwatch.org has been set up to educate the Indian farmer on issues of relevance especially in the new context of WTO. Globalisation has engaged with on terms that negotiated through political democracy and information is seen as playing critical role in enhancing political democracy.

Gyandoot (www.gyandoot.nic) has been a major step towards provision of citizen services in an accountable manner through an intranet linked to information and citizen services kiosks operated through entrepreneurs. Initiated in the district of Dhar in Madhya Pradesh it now covers 16 districts of the state. Most of the work relating to computerisation of land records has been completed and by March 2003 all tax systems would also have been completely computerised.

Madhya Pradesh has taken human development reporting to the village level. Village Education Registers and Village

Health Registers map the situation in the sectors of education and health and update them at regular intervals.

Supplementing political institutions with social and communitarian institutions

Madhya Pradesh made a conscious effort to rejuvenate some communitarian institutions and practices which seek to use social energy for development. One significant initiative has been the “grain bank”. Grain banks used to be managed by communities to tide over adverse conditions in years of crop failure. It is a common pool of grain to which all members contribute and draw according to their need and repay. The system operates through peer pressure and community bonding. It becomes an appropriate model in those villages which remain inaccessible during parts of the year and to address seasonal hunger especially during rainy months. This practice was revived in villages identified as prone to hunger and malnutrition and over 2500 villages now have grain banks managed by self help-groups.

The system of Gram Nyayalayas has been revived and also the institution of family courts has been brought into existence in Madhya Pradesh. The Madhya Pradesh *Gram Nyayalaya* Act came into effect from 26th of January 2001. It was proposed that 1580 *Gram Nyayalayas* in all the districts barring the four districts of Mandla, Dindori, Jhabua and Badwani would be established. A total of 890 Gram Nyayalayas out of 1580 proposed have been established till September 2002. Family courts have been brought into existence in seven major cities.

Formation of Self-Help Groups where people come together for micro-finance activities has seen a major revival in the state between 1998 and now. These Self-Help Groups begin as Thrift and Credit Groups and later move into activities of micro-credit for economic activity. They are supported through a series of government programmes like the Swarna Jayanti Gramin Swarajgar Yojana, the Swashakti Yojana, the Swayamsidha Yojana, Indira Gandhi Garibi Hatao Yojana (DPIP) etc. These Self-Help Groups are also created in other programmes like the Watershed Management Mission, Joint Forest Management Programme, and the Padhna Badhna Andolan. These Groups also constitute a democratic platform which uses collective resources for development.

Self-Help Groups are being formed in the state also by voluntary organisation on which data is difficult to get. From the information available, as on June 2002, there were at least 2,60,000 self help groups in the state. If we assume that the membership would average a conservative ten, it would mean that 26 lakh families are involved in self help groups in the state. The Table 4 shows the share of groups promoted under different programmes as collated from the Commissioner Panchayats and by a study by MP-LEAP.

The most important initiative made by the state in grass-roots democratisation has been the move towards Gram

Table 4: Self Help Groups in Madhya Pradesh

Swaraj. Here the process of political decentralisation is at one level deepened up to the village and at another level is transformed to embrace the entire community where powers vest with the Gram Sabha. While the law for the creation of Gram Swaraj was enacted in 2001, the institutions are gradually getting into place. The system works through stakeholder groups for key activities and has an omnibus committee in the form of a Village Development Committee. This has within it a Gram Kosh or a repository of funds. Government is placing funds with this Gram Kosh as well as empowering the Gram Sabha to raise resources to supplement the Gram Kosh. As the institutional arrangement consolidates, the scope for direct community action increases manifold.

Madhya Pradesh has also seen a rapid growth in the number of voluntary action groups, professional Non Government Organisations, and other civil society-based community organisations all of which cumulatively add to the democratic platform. The challenge before them is to position themselves in a way that political and social democracy is enhanced through collaborative action and not subverted or subordinated through claims of expertise. Intermediation by expert groups have to acknowledge the superiority and legitimacy of political democracy which provides for *inclusion* and as a normative ideal with even efficiency coming only next after the cardinal norm of inclusion which encompasses the right to define expertise. Capacity building for democratic decentralisation emerges as a natural challenge to give the critical edge to the entire process of democratic decentralisation.

Constraints of macro-economic factors

In the current macro-economic context there are increasing limitations on sub-national entities like state governments to effectively intervene for human development. This needs to be

articulated, as there is an increasing tendency to pass on responsibilities to states on a “states-better-get-smart” argument ignoring historical factors that limit capabilities and state action. Direct public action to improve social indicators is definitely important as it could be used to improve upon or neutralise the minimally positive or even negative fall-outs of the larger process of economic growth. However it has to be seen whether the process of growth is leading to increasing unemployment, increases in income inequality, loss of social security, and such other factors vital for human development. In the Indian context there are many ways in which monetary and fiscal reform have eroded the ability of the state to implement appropriate social policies. Principally, the scope has been limited for government spending on the social sector by reducing the government’s revenue base as well as forcing cuts in deficit-financed spending.

It is abundantly clear that there are initial winners and initial losers among Indian states on the rocky road to economic reform. However as yet there have not been any significant compensatory mechanisms in public policy at the national level to narrow this widening gap which could have a negative impact on human development, especially since the initial loser states are also the same states with historical burdens of low human development. The Mid-Term Appraisal of the Ninth Plan has highlighted this as a serious issue. The Eleventh Finance Commission has noted that states with good infrastructure are attracting private investment in much larger measure than states where infrastructure is weak, and suggested that Central investment should be directed taking this into view. Clearly it follows that in years to come, larger proportion of Central assistance to states would have to be devoted to attainment of basic human development objectives, and the closing of the infrastructure gaps in poorly endowed states. Allocations of Central assistance to states would have to follow a more direct approach in terms of the existing gaps in the provision of basic minimum services and infrastructure. The larger the gap between the level of facilities available in a state and the national average, the greater would have to be the allocation to ensure that no state lags behind.

The Table on Capital flows in the Annexure 1 shows Capital Flows to States substantiating the inherent inequity in the situation that is getting accentuated. Just looking at the figure of the per capita plan outlay and the per capita institutional investments, states like Madhya Pradesh fall well below developed states.

The fact that our central planning system has not been able to address this increasing gap can be seen from the data on agreed outlays of the Tenth Plan and its comparison with Ninth Plan. States like Madhya Pradesh, Bihar, Uttar Pradesh, and Rajasthan fair poorly in terms of Tenth Plan outlays (they show negative growth compared to Ninth Plan agreed outlays) while many other states, including states with better economic and infrastructure indicators such as Andhra

Pradesh, Tamil Nadu, Maharashtra, fare much better. Increasingly a case of winner takes all seems to prevail as the sharpest increases are in those states which have much higher levels of private investment, developed infrastructure and better human development indicators.

External assistance, which in over all terms may constitute only 0.4% of India’s GNP, is also skewed in favour of a few states. The Mid Term Appraisal of the Ninth Plan by the Planning Commission admits that seven states namely, Andhra Pradesh, Maharashtra, Uttar Pradesh, Tamil Nadu, Gujarat, Karnataka and West Bengal received more than eighty percent of the entire external assistance. Data on state wise external assistance is presented in Annexure 2.

A sensitive reform-based funding would actually focus on softening the immediate adverse impact of reform on these states and instead the current thinking seems to be to reward those with initial advantages on the grounds of moving faster on the reform track. While Madhya Pradesh is seen as a reforming state for such assistance, its larger case rests on the backlog in infrastructure and human development which requires additional resource support. It will also not be correct to highlight inadequacies in human development without reference to the possible relation this has with the strategy of growth being pursued and its impact on the resources available for social policies. In recent years states have been deprived of their expected share in central taxes. The decline in central tax-GDP ratio implies that the volume of tax revenues transferred to the states is being squeezed. This is of far greater consequences to states since their ability to borrow is not as flexible as that of the Centre. States are increasingly facing a major resource crunch to sustain a reasonable social policy agenda.

Constraints of Centralised Planning

While the above sections tried to give an overview of how Madhya Pradesh has attempted to put democracy to use in improving its human development indicators, this effort has been stymied by the dominance and proliferation of Centrally Sponsored Schemes. Centrally Sponsored Schemes limit efforts by state governments to empower local bodies and have been vitiating the principle of federalism. Chief Ministers of States had raised this issue and in the National Development Council there was a consensus on transfer of CSS to states with resources. This however, has not been implemented. The legal validity of the Centrally Sponsored Schemes is weak because many areas where these proliferate are areas belonging either to the State-List of the Constitution (Rural Development, Health, Agriculture) or to the Concurrent List (Education). It is also to be pointed out that after Seventy-third and Seventy-fourth Constitution Amendment, functions in these areas have been demarcated for local bodies. Post Census 2001, it is very clear that India is more than ever characterised by uneven development. Problems, especially in the human development area, are no more “Indian” problems but

problems of select Indian states. These therefore call for state-specific responses and strategies built on specificity of state-situations. CSS fails the human development agenda by not allowing such differential responses to emerge.

It is abundantly clear after years of planning that Central Planners have ignored strategic planning. People should be seen as a strategic resource to be deployed on finding solutions to India's development challenges. There are several examples of state governments managing to achieve results by adopting such a methodology and some instances of these in Madhya Pradesh is listed in this early part of this Chapter. However the critical issue in addressing human development is the assertion of intersectoral institutional frames. This is precisely the opportunity provided by the architecture of political decentralisation and its sub-optimal use wastes the sectoral resources deployed on the agenda. It is unfortunate to watch the multiple exercises of "sectoral reforms" being unfolded in each sector ranging from health to water supply to forestry ignoring the fundamental matrix of political decentralisation. It is also a weakness of Human Development Reports that while they have been strong on sector analysis, when it comes to solution, nothing better is offered except to increase investment in the particular sector. The equally important issue is to invest those resources through appropriate multi-sectoral institutional arrangements that create a cumulative impact across sectors and maximise returns even at the same time strengthening political democracy.

States that take the human development agenda seriously like Madhya Pradesh work under the constraints of centralised planning that prevails in spite of the consensus in sub-national political levels and academic circles against CSS. Centrally Sponsored Schemes should largely be only in the areas of "capacity building, inter-sectoral coordination, outlay

monitoring, and impact studies of state-sector projects" as rightly mentioned by the Planning Commission itself in its Approach Paper to the Tenth Five Year Plan. The full potential of democratic decentralisation in furthering the human development agenda gets limited in the current context.

Refining HDI: Including a Scheduled Tribe-Scheduled Caste Development Index

Now that sub-national Human Development Reports have become an accepted practice in India to measure attainments it is perhaps time to revisit some of the indices. There is a need to look inward, within the country to identify groups that fare poorly in human development as against spatially in terms of how districts fare or how sectors fare. Deprivation in India has an obvious face of exclusion, the scheduled tribes due to social exclusion and the scheduled tribes due to geographical and cultural exclusion. Scheduled Castes suffer social deprivation on account of the residual power of a discriminatory caste system which though made illegal continues sway as a social force whereas scheduled tribes see their predicament as victims of the state which denies them property rights to their habitat. A Scheduled Tribe-Scheduled Caste Development Index needs to be developed by professionals to capture their deprivations so as to goad state policy to address them. A broad attainment index does not effectively address the roots of these very important deprivations in the Indian context. The process of democracy is at work drawing these people into the mainstream and seeking to address their specific concerns. How well this is being done needs to be assessed through the development of a Scheduled Tribe-Scheduled Caste Development Index. This is a task we are identifying for our next Human Development Report by which time relevant census information will be available.

Universalising Elementary Education in Madhya Pradesh

“Now, this schoolroom is a Nation. And in this nation there are fifty millions of money. Girl number twenty, isn't this a prosperous nation and a'int you in a thriving state?”

“I thought I couldn't know whether it was a prosperous nation or not, unless I knew who had got the money and whether any of it was mine,” said Sissy, wiping her eyes.

(Charles Dickens, *Hard Times*)

Sissy Jupe's problem as to how one determines the quality of life of a human being persists. It is not enough to know about the availability of resources, but also of their distribution and quality, and it is not enough to know only of the economic resources but equally of the other social resources that help people conduct their lives. If the quality of life cannot be neatly set forth in tabular form, because it involves complex questions of human perceptions, relations, choices and opportunities, what kind of measurement can be trusted to give a satisfactory account of well being? The question becomes more complex in considering issues like education, where the understanding of education can sweep such a wide spectrum that while its one end may permit simple formulations, its other end gets increasingly problematised because it raises questions about the meaning and end of human life, the nature of human values, freedom and capability-questions on which there is no easy consensus, and even if there is, no easy forms of assessment.

Education as an expression of human development is seen to have both intrinsic and instrumental value. Such an understanding of education requires methods that assess the availability of educational resources as basic opportunities, and its quality. Quality itself is a complex issue. It requires an evaluation of skill development, and comprehension which can range from scholastic aptitudes that are more commonly measured to the capacity to analyse and connect practical applications and abstract thought which is still not commonly assessed to the capacity for critical enquiry which is more difficult and almost never assessed. Whether a person is educated or not, whether a system is imparting quality education will thus depend on which end of the spectrum one chooses to look from.

In attempting to describe the status of elementary and adult education in Madhya Pradesh, the effort has been to assess the distributive aspects on the basis of data available,

and for qualitative aspects to focus on the processes to assess whether they seek to enable more informed, more professionally competent interactions in schools for improving learner comprehension. Going beyond the question of scholastic capabilities to assess whether educational initiatives seek to promote greater equity and enlarge the scope of freedom is difficult because it hinges on issues of a complex societal character. However, being an issue that ultimately defines the essence of education an attempt has been made to examine the process of educational management to see whether the education system redefines relationships within the school and between the school and the community in a way which seeks to transfer power to those whose education is in question. With this understanding, the key indicators of elementary education commonly prevalent have been accepted to describe the current status. These are discussed below.

KEY INDICATORS OF ELEMENTARY EDUCATION

Key indicators of educational attainment are defined as

- Universal access to elementary schooling
- Universal enrolment of children of age group of 6-14 years.
- Universal retention of all enrolled children till they complete elementary schooling
- Universal achievement, implying that all children acquire satisfactory levels of learning.
- That education intervenes effectively for equity.

THE CONTEXT OF MADHYA PRADESH

It is significant that whereas the National Policy on Education of 1987 (revised 1993) – stipulated Universal Elementary Education (UEE), the state documents of policy and programme do not talk about UEE till about 1994. Prior to 1994, the state's action for education is evinced in discreet, dispersed, small incremental accretions of schools. These

additions too, are on an ad-hoc basis, without realistic estimates of the size of the problems and the impact of the additional benefits. No goals are set to measure performance against policy. If discourse is an indicator of government commitment which, because the process of development is a continuous one it is, then this absence of a consciously articulated strategy for UEE is a sort of indicator of the level of awareness and commitment to UEE. The year 1994 marks the first-ever efforts to address the goal of UEE, beginning with an increasingly growing concern of the state for universal primary education and by 2000 moving up to a concern for universal elementary education. It is significant that this concern sparks off with the emergence in the state of the elected panchayats dotting almost each village with a Panchayat Raj Institution (PRI). The idea of universality pushes itself up as an inevitable corollary of the deepening and broadening of the democratic process up to the village level. State educational planning moves from piece meal provisioning to a concern for All and a search for strategies that address All. This was challenging in view of historically entrenched problems.

Historical Challenges

The 1991 census revealed that in Madhya Pradesh, 56 percent of the population was illiterate, 70 percent women were not literate. Literacy rates were lowest for the scheduled castes and scheduled tribe i.e. 35.1 percent and 21.5 percent respectively. Access to schools was a problem, which had both physical and social implications. This was because the norms for opening a school in a village with population between 250 and 300 ignored the scattered and inaccessible habitation pattern of the state, where people live dispersed in small household communities, one to four kilometres away from the main village. These areas are generally inhabited by socio-economically deprived communities resulting in their needs getting submerged within standardised norms and strategies. Till 1996, out of 0.11 million habitations in the state, approximately 30,000 were without basic schooling facility. A centralised and highly bureaucratised education management system created its own distortions. Planning was centralised and so failed to reach out to the needs of the people. This perhaps was best exemplified in the norms created for access.

Excessive centralisation had also resulted in inadequate academic support to schools. There was no structural link between the district level academic support structures such as DIETs and the schools. There was no systematic plan for regular in-service teacher training. No effective system of academic supervision, feedback and discussion existed at the school level, the supervisor school ratio being 1:80. Education of the community had no lateral accountability to the local community. This was perhaps reflected in the dysfunctionality of the schools, teacher absenteeism and low quality of teaching.

Contesting development needs competed for budget

resources affecting allocations for the education sector. In Madhya Pradesh the expenditure on school education was roughly 10 percent of the total budget and salaries accounted for approximately 95 percent of this expenditure. These constraints were reflected in key educational indicators – Madhya Pradesh had poor access (70 percent), low enrolment (72 percent), low retention (65 percent) and low achievements.

A New Vision

The educational vision of the state is shaped by the overall vision of human development in the state. The development vision of the state has shown a marked movement away from people as recipients to people as agents. The participatory process of development is seen to have as much value as the product at the end, and the extent of its inclusiveness is seen to be as much an indicator of development. This is true of education. The emphasis on education is creating conditions that enable people to come together for their education. Therefore the way a school or a literacy class comes into existence, or gets managed become significant issues rather than simply sanctioning schools from the top. The relationship between the teacher and the local community becomes significant rather than between the teacher and a government hierarchy on top. Whether all children have equal access to opportunities is as important an issue as the quality of opportunities created. The issue of quality itself gets expanded to mean not just the text but also the context. School-community interface, the behavioural responses of children teachers and parents towards the school, social expectations of the school, the sense of inclusiveness and ownership—these intangible attributes start influencing the notion of quality as much as its more tangible features as physical conditions and scholastic measurements. This has certain implications. It requires that the state develop processes and policies that balance local autonomy with normative standards, professional capabilities with a sense of ownership and accountability, structural flexibility with common goals.

New Opportunities

The main emphasis in Madhya Pradesh, since 1994 has been on universalising primary education and since 1999 this concern has enlarged to encompass universalisation of elementary education. The strategic framework for this was created by new opportunities in the State.

DECENTRALISATION OF GOVERNANCE

Decentralisation became the premise for development in the State, because it was seen to open up opportunities for new ways of doing things and because it was possible to create new partnerships. The dichotomy between demand and supply, between provider and receiver could be dissolved. Stakeholders could be given greater control and ownership. The single most significant change in Madhya Pradesh's vision

Parent Teacher Association: Institutionalising local ownership

A critical determinant to the quality of schooling is the extent of local ownership and accountability and the challenge here is to create institutional arrangements that help to establish the school as a unit responsive to the learning needs of the children and the educational aspirations of the community.

The idea of a Parent Teacher Association (PTA) offers an option in this direction. The Madhya Pradesh *Jan Shiksha Adhiniyam* (see Box) stipulates setting up PTA, giving it a legal status. The PTA as the term implies, consists of all parents of the children studying in the school along with all the teachers. The PTA elects a President and Vice President from itself. The Head Teacher of the school is the Secretary of the PTA, which meets once a month.

Recognising the need to strengthen the school as unit the PTA has been given powers to facilitate effective school functioning and to make the school management responsive to the needs of children.

Responsibilities of the PTA include:

- Ensuring cent percent enrolment of children in 5-14 years age group.
- Ensuring regular attendance of students and teachers.
- Assist in the development of school and school assets.
- Present the needs of learners to *Gram Sabha* for availing of the benefits/grants from it.
- Assist the teachers in the discharge of their duties to impart quality education.
- Raise funds for the development of school.
- Motivate illiterates and Neo-literates to wards sustainable continuing education

The Rights of the PTA include the following:

- Preparing the *Jan Shiksha Yojana*.
- Maintain, operate and strengthen *Shala Shiksha Kosh*.
- Decide and recommend a school uniform for the students of the school.
- Monitor the children's growth in the achievement levels in the various competencies of different subjects.
- Supervise and review all development, academic, administrative and financial activities of the school.
- Decide a cess for the development of the school.
- Recommend withholding salaries of teacher in case of wilful default.
- Examining and advising on the Public Evaluation Report (*Jan Shiksha Pradivedan*)

PTAs are at the initial formative stage. The current paradox is that good schools with motivated teachers tend to have stronger, more involved PTAs; and relatively less functional schools have weaker PTAs; whereas the need for strong PTAs really exists for these weaker schools. Currently, the character of the school tends to determine the character of the PTA. Till date, 1,03,546 PTAs have been formed.

A PTA that evolves a reciprocal balance of rights and responsibilities in the interest of the children's learning would offer an instance of participatory school management where local ownership and accountability cohere and the dichotomy between demand and supply, between provider and receiver dissolves.

Training of PTAs then becomes of critical significance.

of development is the recognition of the agency of people as central to development. The relationship between state government and people has been perceived as one of partnership based on mutual right and responsibilities. This has been the guiding vision in the choice of strategies. This vision has been articulated as the new architecture of governance grounded on decentralisation, lateral accountability and increasing space for direct community action. The panchayat system provided an institutional framework for decentralisation right down to the village level. The state government also introduced the system of District Government and recently the village government system, further decentralizing the power of the state level administrative structure to the district and village level. The implication of this development vision is that development is measurable not just through creation of assets and resources, but through the effectiveness of the process of empowering communities to make choices and participate in creating those assets and resources. If this has been the vision, then how did it express itself in the planning of education especially in its basic levels of Elementary Education and Adult Literacy and with what results?

The key objective for educational planning was

decentralisation of educational management. It should be remembered here that decentralisation of educational management here and the attempt to give greater space to direct community participation has been an end in itself because it expresses the belief that strengthening processes of democracy is itself a larger understanding of education.

The effort of the government has been to move increasingly towards user groups at the grass root level, and so establishing structures that enable their direct participation in the management of schools.

The education sector saw a very substantive delegation of powers to the local panchayat bodies and Village Education Committees (VECs). Recruitment and transfer of teachers, construction of school buildings and procurement of school equipment have become the responsibility of the panchayats. The VEC have been reconstituted under the recent amendment in the Gram Swaraj Act, further decentralising powers to the village government acquired a statutory existence and has been entrusted with powers to supervise the local schools. A Parent Teacher Association (PTA) has been envisaged for each school with substantive powers in school management. The PTAs are in the process of being set up.

A significant strategic choice made by the Government for focused action on primary education through decentralised process was the setting-up of Missions on select areas of development to address identified tasks in a time-bound manner. The Mission on universal primary education designated as the Rajiv Gandhi Shiksha Mission was carved out from the education sector for focused action on primary education and adult literacy, and subsequently since 1999, made into a mission for elementary education and literacy for the State. The idea of the Mission, although it started off as a programme delivery, bears significance in Madhya Pradesh because it has evolved into a sustainable structural arrangement for delivering elementary and adult education and has sought to move educational management into a more participatory, societal mode.

The emergence of the State government policy of decentralisation and support to community processes coincided historically with the entry in the state of a major externally aided programme in the education sector. This was the District Primary Education Programme (DPEP) introduced in 33 districts of low literacy in the state, in 1994 in its first phase and 1997 in its second phase. DPEP's concern for decentralised participatory action aimed at improving primary education was in consonance with the state government's policy. The strategic framework of DPEP was constituted by elements of district based decentralised planning and community participation, emphasis on capacity building of teachers, teacher educators, educational managers, space for contextual innovation, a wide array of strategies ranging from social mobilisation, material development to infrastructure improvement and adopting a societal Mission approach to implementing basic education programme. Decentralisation and the resources made available to the state under DPEP created opportunities for innovative action to address long standing problems.

By the beginning of the tenth plan, the issue of universal elementary education has been addressed through a comprehensive programme – the Sarva Shiksha Abhiyan, which will reinforce the work for strengthening the primary base, and build the upper primary base.

Decentralised, participatory problem mapping

Decentralisation opens up the possibility of alternative lateral thinking critical for development. The problem of development is to find ways of understanding and articulating the needs of the community undocumented or obscured by predetermined categories of planning needs. The only way to do this is to encourage shifting the perspective from the government to the community. Looked at from the point of view of the community, the problems may be re-defined, provoking a review of existing assumptions and norms. Solutions will emerge and planning norms move closer to people's needs-as the people themselves perceive them to be.

Decentralisation of education has facilitated the introduction of alternative methods of participatory problem mapping. A system of collective micro planning on a habitation basis to assess the status of children's schooling out of school and educational & infrastructure facilities was initiated to enable disaggregated problem mapping. This was designated Lok Sampark Abhiyan (LSA). The first LSA was undertaken in 1996 and the second in 2000-01. LSA-I aimed at finding out how many children were going to school, what were the reasons for those not doing so, and what was the outreach of schooling facilities. LSA-I conducted in 1996 covered 55,295 villages and contacted 6.1 million households and 10 million children. LSA-I revealed that only 70 percent of the habitations had access to primary schools. LSA-I also demolished the myth of universal enrolment. Enrolment was not more than 70 percent. Most children reported as dropouts had never been enrolled. The most deprived were girls and children from scheduled tribes. Another round of household survey was carried out as LSA-II in 2000. It identified middle school gaps and measured the progress of educational indicators at the primary level and established a benchmark for the upper primary. It has made possible the formulation of a comprehensive state perspective UEE plan with district specific perspective plans. Lok Sampark Abhiyan (LSA) I and II become important processes for documenting status, drawing attention to gaps and provoking prompt action and demonstrate the efficiency of decentralisation, which is the premise for planning. LSA I and II make possible the measurement of attainments of key educational indicators in a comparative frame of 1996 and 2001 – a period of 5 years, beginning after the first HDR that flagged a set of issues for educational planning. The issues that have been addressed on priority by the state working towards universal elementary education are discussed below.

Creating access to elementary education

LSA made visible the large access gaps particularly highlighting the very deprived areas and groups. Current norms of school provisioning stipulated a primary school within a kilometre and upper primary or middle school within 3 kilometres of the habitation. LSA also threw into relief the nexus between geography and deprivation – both social and economic, since most of the unserved habitations were inhabited by SC/ST groups revealing access to be a social issue and not just a physical one.

a. Access to primary schools

Responding to the demand for schools, the state Government evolved an innovative scheme for universalising access. This was the M.P. Education Guarantee Scheme (EGS). EGS was launched in January 1997. The scheme is sensitive to the habitation pattern in the tribal areas of the state where people reside in hamlets called majras, tolas or phalias that are distant

Myths like ‘Non-Formal’ and ‘Para Teachers’

Discussion on issues of universalising elementary education of quality in a cost-effective manner will require moving beyond certain fuzzy categories which trap the delivery of universal elementary education such as ‘Formal’ and ‘Non-Formal’, — ‘teacher and para teacher.’

Educational initiatives would have to be understood and assessed in terms of their objectives and context rather than by terms like formal school and non-formal centre in the way they are currently used to denote superior-inferior systems. Some attributes derived historically have been associated with the term formal school. These are four-to-five hours of schooling, clearly marked grades with fixed duration, usually of a year each, a fixed curriculum and an affiliation to a recognised public system of examination and certification. That this is an inadequate description and in no way a definition is evident. Within a broad framework, there are differences expressed in the form of management, materials, teachers, infrastructure, academic processes, system of evaluation and promotion. According to the Oxford Advanced Learner’s Dictionary, the word ‘formal’ includes a definition of formal ‘education or training received in a school, college or university with lessons, examinations etc., rather than gained through practical experience.’ Looked at like this, all non-formal centres, the government at State or the Centre has so far supported are highly formal schools. The terms formal and non formal will have historical and relativistic connotations and should not be used as judgemental categories.

In this context, the EGS that Madhya Pradesh introduced in 1997 perceives the school as a process that evolves towards acquiring attributes of higher quality, rather than a static entity reified as formal and non-formal.

from one another. A historical backlog of about 30000 accessless habitations could be eliminated in 2 years time. The EGS also aimed at time bound provisioning of schools and was therefore postulated on Government guaranteeing a school in 90 days. EGS works through a tripartite sharing of responsibilities between panchayats, community and state Government. Now every habitation in the state has a schooling facility within a km. By August 1998 Madhya Pradesh declared universal access to primary education (*Annexure-1*). The benefits of the EGS have gone to the backward areas and the deprived children. About 40 percent of the EGS schools are in tribal areas, 45 percent children are from ST families, 91 percent children are from SC, ST and other backward classes. Universalisation of access through EGS clearly indicates that it is not just a geographical outreach, but also a very significant socially inclusive strategy.

The state government’s intervention has been very significant in creating access in the primary sector where the government’s share is 84 percent. The government policy for private schools is liberal. Anyone can open a school, with an affidavit, since no prior permission is required. The idea is to encourage a wide network of institutions for primary education.

The second set of oppositional terms associated with the formal and non-formal debate, is the teacher/ para teacher issue. If the teacher is meant to be one who is on a permanent official pay roll, then private schools or most American universities who employ people on contract would be said to have para teachers on roll. If teachers mean people paid officially fixed salary scales then the same situation would follow. If teacher means a certain level of remuneration decided by Pay Commissions then again, several teachers in private schools would become para teachers. If teacher means a full time teaching person, then several teachers called para-teachers would deserve to be called teachers. If qualifications are stipulated, then again a large number of teachers would become para teachers, because eligibility criteria are not uniform either among state governments, or among private schools. Conversely several so called para-teachers would become teachers because they have the same qualifications as those of the official teachers such as the gurujis of Madhya Pradesh’s EGS. If modes of recruitment are considered then, again a large number of para teachers become para teachers because recruitment modes and procedures are widely differing among states and among private institutions.

The dichotomy between school and centre, teacher and para teacher would have to go. The focus should be on children going to schools assuming the terms to indicate the diverse forms that schools can and ought to take, rather than on fragmenting children into categories going to formal schools and NFE centres. This is not a matter of semantics. It perpetuates cumulative deprivations for those children who most need the learning opportunities that are available.

b. Access to upper primary

A gap of about 7575 schools was estimated as of 2000. 7575 schools are being upgraded into upper primary (*Annexure 2*). This will ensure universal access to the upper primary, implying that each primary school has an upper primary schooling facility within 3 kilometres. In the case of upper primary, 66 percent of upper primary access is through government funded schools and 34 percent through private.

The issue of quality

The issue of quality has been comprehensively defined to include diverse factors that impact on school effectiveness. This includes the following:

- Physical infrastructure
- Academic inputs and processes
- School management
- Physical infrastructure – The quality of learning space

Physical infrastructure – The quality of learning space

Emphasising decentralised construction of school buildings, encouraging community participation, has resulted in lowering construction cost. Programmes like DPEP have contributed towards gap filling in the physical infrastructure. 236

Block Resource Centres (Teacher Training Centres) have been constructed in 33 DPEP districts to facilitate teachers' training at the block level. A big gap of 20000 schools without buildings was covered in a space of five years. Decentralised construction through village level committees and cost effective techniques have characterised such construction.

Drinking water facility, toilets (common and for girls) have been provided to the government school through convergence of resources and community contribution. Percentage of schools with drinking water facility has increased from 57 percent in 1997 to 66 percent in 2000-01. Despite the efforts that have been made to mobilise resources from different programmes to provide school buildings large gaps in infrastructure persist. Annexure-3 shows the status of schools without buildings and without drinking water and toilets.

The quality of academic inputs

Key issues in the improvement of the quality of academic inputs are of resources, teacher provisioning and teacher qualification, curriculum and teaching learning materials, capacity development of teachers, availability of academic support to schools and teachers and the system of evaluation.

a. Provisioning of teachers (Pupil-Teacher Ratio-PTR)

A suitable pupil teacher ratio is necessary for ensuring quality of learning. The system of multi-grade teaching affects the efficiency of teaching learning reduces time for transaction and specially for process of continuous evaluation alternative for diagnostic and remedial action. Comparison of data of enrolment and teachers of different years shows a rising trend in PTR because of increase in enrolment.

Year	Number (in lakhs)		PTR
	Enrolment (I-V)	Teachers (Primary)	
*AIES 1993	82.46	1.78	46
** Year 2000-01	69.42	1.46	47

* Including Chhattisgarh

** Data of government schools of M.P.

The present PTR at the upper primary level is 38.

The State government has taken a number of decisions about teachers. First, the cadre of teacher appointed on a permanent basis on a government pay scale has been brought to an end. In its place teachers are appointed on a contract basis. Teachers are employed by panchayats on a fixed contract, which has been pitched at a lower level than the old scale. This has been the corollary to the panchayat-based decentralisation. The eligibility criteria, in terms of minimum educational qualifications have been the same as for the earlier lot of teachers. There are 3 main types of teachers i.e. the traditional assistant

teachers; teachers appointed by local bodies comprising of the Shiksha Karmi and Samvida Shikshak who are the contract teachers and the Gurujis of EGS schools. The latter two types are appointed against schools and are not transferable. EGS gurujis are chosen by the local community and are local residents. The same minimum educational qualification is applicable to all but the recruitment procedure differs which affect their perception of themselves as teachers. The Shiksha Karmis and Samvida Shikshaks are accountable to block and district level panchayats bodies, while gurujis are accountable to the local community. Fixing teacher remuneration at a lower level and devolving teacher recruitment to block panchayats led to a rapid provisioning of teachers. Sample data reveals that the new policy towards teachers has encouraged a greater number of women and persons from SC and ST and OBC groups to enlist as teachers. This can be attributed to three reasons. Local recruitment, therefore greater dissemination of information and awareness, recruitment against school and therefore non-transferability of service, broader-based character of panchayats as recruitment agencies therefore greater sensitivity to issues of caste and gender.

b. Curriculum

The curriculum of primary level was reviewed in 1994 to introduce elements of competency based, activity based and child friendly pedagogy. Based on the new curriculum, the state has now introduced new teaching learning materials at the primary stage. Textbooks are self contained and each textbook is divided into a number of lesson covering several teaching sessions, each of which comprises signposting to the specific competencies addressed, student material and teacher guidance in the form of footnotes. The textbooks have a shelf life of five years, after which they are revised in the light of experience, evaluation and changing ideas about teaching and learning. Review of the curriculum and materials for the upper primary is in process. The need for a rich pool of useful teaching learning materials as alternative learning sources beside the textbooks, has been recognised. This is being served through a school library movement implemented in a phased manner. School libraries have been established in 982 JSKs and 8582 EGS schools. Procedures are also being established to open up the school libraries to community after school hours, by integrating them with the libraries established under adult education programmes and to encourage systems of community ownership and user fee.

The potential of information technology has been recognised to enrich educational processes. A programme for Computer enabled education has been introduced at the elementary school level to provide computer – enabled education to rural school children. 648 Jan Shiksha Kendras have been covered under this programme named Headstart 2429 teachers have been trained in two phases. Positioned in rural schools Headstart aims at bridging the digital divide. A

syllabus for Headstart lessons has been developed. Educational software on Language Hindi and English, Mathematics and Environment Sciences has been developed to help the teachers reinforce textual materials and encourage children through interactive learning. These multi-media rich lessons aim at strengthening learning competencies and expand the knowledge base of students and teachers and develop computer literacy along with it.

c. Teacher Education

The variety of teachers poses challenges for training:

- Differences of training requirement get aggravated, and that too, on a very large scale
- The state government has not had a policy of pre service training as a mandatory pre requisite for teacher recruitment. Therefore quite a large number of teachers and specially *shiksha karmis*, contract teachers and *gurujis* do not have pre service training. This creates a need for careful perspective planning for developing their capabilities.
- In addition there are pedagogical challenges created by first generation learners and heterogeneous multi age – multi ability groups.

The strategy for training therefore has been sensitive to these complexities. Trainings have focused on the primary teachers raising the number of teachers trained from an average of 473 per district per year to 2731 per district per year from 1994 to 2001. Average teachers trained per year since 1995 have been approximately one lakh. The mode of distance learning has been used to supplement teacher training. 4050 teachers have been trained through this mode, on an average annually since 1996. Teacher training till recently tended to be highly centralised. Training modules were developed at the state level and run uniformly throughout all districts. Over the recent years because of continuous decentralisation of programme management and focus on learner evaluation especially in terms of learning outcomes, the need for decentralised and contextualised responses to teacher training requirements was acknowledged. The state teacher training policy now has decentralised basic inductational and in-service training to the districts. Districts map and analyse their training needs, and develop and implement their training plans. This policy has been put into effect full scale for the year 2001-2002. For the professional development of existing teachers, new contract teachers and *gurujis*, a decision has been taken by the State Government to reserve the seats of D.Ed and B.Ed. courses in Government institutes for them.

d. Learner evaluation

The State Government followed the policy of non-detention till the upper primary level with only the District Board Examinations at the end of the Vth and VIIIth classes. This policy was changed in the academic year 2000-2001 wherein an annual examination had to be cleared for promotion to the

HEADSTART: Improving quality of learning through Computer Enabled Education

Head Start is a programme for Computer enabled education introduced in selected government elementary schools in rural areas. Headstart aims at improving the quality of education by providing CD based Multi Media Rich Lessons (MMRL) for the use of children and teachers based on an analysis of their knowledge base and learning needs. These multi-media rich lessons aim at strengthening learning competencies and expand the knowledge base of students and teachers and develop computer literacy along with it.

The educational software is developed in-house by the Rajiv Gandhi Shiksha Mission based on research into curriculum, materials, teaching learning processes and knowledge levels leading to the identification of concepts that pose difficulties in transaction as well as areas for knowledge enrichment. The challenge is to use technology shift for a paradigm shift in pedagogy, by making it interactive, interrogative, self-learning and discovery through error, enquiry and reasoning. Since Headstart aims at quality improvement, it is not seen as a stand-alone intervention, but an integral part of a total teaching learning process within built-on-line - off-line activities to be evaluated for assessing the quality of learning outcomes.

A syllabus for Head Start has been formulated to guide material development. Educational software on Language, Mathematics and Science has been produced and provided to schools. The distinctive features of Headstart are customised culturally familiar educational software in Hindi, Mathematics, Science and English emphasis on learning through computers whereby computer literacy is an inevitable spin-off and integration with a total teaching learning process. Currently Headstart is located in 648 elementary level government schools that also act a school cluster resource centres (*Jan Shiksha Kendras*) where teachers meet once a month for academic sharing. It is poised to expand to 2070 *Jan Shiksha Kendras* by 2003 and cover the remaining 2000 *Jan Shiksha Kendras* in 2004. 4000 Teachers have been trained on the technical and academic aspects of Headstart. A Headstart unit includes 3 computers, printer, UPS and ancillaries and costs about Rs. 0.14 million.

higher grade. The new policy of learner evaluation stipulates quarterly tests conducted internally with cumulative credits classifying achievements under grades. Diagnoses of assessment outcomes are expected to be followed up by remedial action. This is to be done at all levels starting from school to JSK, Block, District and State level to evolve clear methods to provide academic support to the school. Difficulties captured through this learner evaluation analysis are expected to enable the teachers to focus on problem areas so that remedial action can be taken at the school level. Periodic external evaluation is planned in order to create a more detailed understanding of factors that promote quality of learning. This is expected to enable the teacher to undertake remedial action for low achievements.

e. Decentralisation of Academic Support

To strengthen the academic support system, DPEP helped to create a bridge from the school to the academic institutions at the top by establishing 236 Block Resource Centres (now designated Janpad Shiksha Kendra) at the block level, and 4325 Cluster Resource Centres (now designated as Jan Shiksha Kendra) located within primary or middle schools and serving groups of 10-15 schools. The Jan Shiksha Kendra (JSK) has an academic coordinator Jan Shikshak who is a senior teacher. The Jan Shikshak is expected to visit the schools for purposes of academic monitoring and facilitates teacher discussions at monthly JSK meetings. This has made possible the regular supervision of schools, reducing the ratio of supervisors to schools from 1:80 to 1:20. The Jan Shiksha Kendras have the potential to grow as peer support hubs at levels closer to the school context.

f. Restructuring of academic support institutions

Restructuring of academic support institutions has been acknowledged as a key area of concern and the state has initiated review of the academic requirements of key institutions. The state government has recently undertaken professional reorganisation of academic support institutions (SCERT and DIETs) seeking to restructure these institutions on the following premises to create the necessary pre-conditions of quality support.

- Clear delineation of academic criteria comprising of knowledge specialization, academic qualifications, school experience and evidence of professional development for the purpose of staffing.
- Rotational placement between academic support institutions and school to ensure mutual enrichment of theory and practice.
- Emphasis on subject faculty structure to ensure that core curricular inputs are designed and implemented by competent professionals.

While technical and financial support from the state to the district level (DIETs) will continue, district level academic support institution are to be made laterally accountable to districts for management purposes. DIETs will be responsible for the academic planning of their districts, ensuring its implementation and quality assessment.

SCHOOL MANAGEMENT

School Management has been decentralised to the district and sub district levels. Recognising the need to strengthen the school as a unit, the PTA and the VEC have been given powers to decide on issues that impinge on the daily functioning of the school, such as school timing, local holidays, monitoring the regular functioning of the school. Teachers are now expected to be accountable to the local PTA and the VEC, This is expected to make the school management responsive to the needs of the children.

Emphasis has been given to each school to develop its own development plan with participation of parents. This would then be the basis of the village education plan and upward to get integrated into a District education plan. Teachers are expected to help in developing village education registers to record and track each child’s movement through school.

Decentralisation of school management and the policy to make it accountable to the local structures such as PTA, VEC and panchayats is expected to help in enabling school management to orient itself to the educational needs of the children. However, the process of institutionalising these lateral relationships is new and needs to be firmly grounded and strengthened for it to yield expected results that can become effective indicators of the transition of school managed as end –links of a bureaucratic machinery to becoming community schools locally managed with sufficient autonomy, such as is evident in relatively greater measure in the state’s Education Guarantee Scheme (EGS) schools. In the EGS schools, the local community chooses the teacher, gets a grant from the state government to run it’s school and forms

Modalities of EGS

EGS is a demand-based; time bound strategy to universalise access. It has enabled us in reaching out to the un-reached in quickest possible time. The key elements of the EGS are as follows:

- Under EGS, the government gives guarantee to provide a primary schooling facility to the children in a habitation where there is no such facility within a kilometre within a period of 90 days of receiving a demand for such a facility by the local community.
- Community without a schooling facility within a distance of 1 km and 40 children (25 children in case of ST population) can demand schooling facility.
- Community chooses teacher, provides space and supplements resources.
- Government trains teachers, provides free Teaching-Learning Material and school contingency, academic supervision and seed money for infrastructure.
- Government releases its grant to EGS school account maintained at village level.
- The EGS operates on a decentralised basis through collaboration of the State Government, local bodies and the community. Decentralised management of EGS is done by local Parents Teacher Association.
- The EGS teacher is designated as 'Guruji' and is provided for a group of 40 children and in tribal areas for a group of every 25 children. If the number exceeds 50 then another Guruji can be appointed so as to maintain the teacher-pupil ratio near 1:40.

The academic level and progress of each child is evaluated on a continuous and periodic basis. Continuous evaluation is inbuilt into the teaching learning material and also imparted through teacher training. There is also a provision of Quarterly exams.

a PTA that manages the school completely, academic support coming in from the Jan Shiksha Kendra.

INSTITUTIONAL RESTRUCTURING

The management of education has been steadily decentralised both vertically and laterally. Decentralisation has created opportunities for Institutional Restructuring. Prior to decentralisation educational management was characterised by multiple agencies with scant coordination and since decision-making was centralised it actually created multiple sources of authority located on top leading to a situation where directives abounded, but action at the end-point became unconnected, if not conflicting. Decentralisation makes possible coordination and convergence and as this increases the closer one moves towards user-groups, direct participation, and local self-management. Decentralisation because it re-locates powers and functions and necessitates a realignment of structures. In the elementary education sector, substantive powers have been delegated to the panchayats, District Planning body and now to the VEC and PTA. The role of administrative and technical bodies is now seen as being one of laying down broad parameters and norms, facilitating, monitoring, and problem solving and resource-support. With decentralisation transferring powers locally, and allowing flexible planning, coordination and convergence of structures for ensuring that a common perspective informs all action was perceived as a necessary condition. Accordingly, administrative arrangements for integrating structures have been initiated. At the state level, Elementary and adult education programmes have been brought under one agency designated as the Raja Shiksha Kendra that has been created by bringing the Directorate of Adult Education, the state project offices for various projects, and the SCERT together into one common institution. District and block level elementary and adult education structures have been integrated as Zilla Shiksha and Janpad Shiksha Kendras so that the different agencies involved in planning and implementing these programmes come together for coordinated action. The unit for school support that is seen to be the most critical is the school cluster resource centre or the Jan Shiksha Kendra.

Institutional restructuring which is the most critical premise of educational reform is being effected through internal rationalisation of resources and does not require any additional financial support. In fact, it has led to a better utilisation of existing resources.

KEY INDICATORS: STATUS OF ELEMENTARY EDUCATION

As a result of these strategies, key indicators reflect the following status of the participation of children in schools.

Enrolment in Primary schools

Gross Enrolment Ratio (GER) has risen from 76.5 percent in 1996 to 96.2 percent in 2000-2001. The GER of girls has risen

JAN SHIKSHA ADHINIYAM : An Act for creating public accountability for quality

M.P. *Jan Shiksha Adhiniyam, 2002* is shaped by the vision of education as a collaborative process of the teachers, learners and the local community and the role of the government as facilitating this process towards the twin goals of equity and quality. The Act recognises the right of every child to basic education and seeks to remove impediments to access and participation in schools both by improving delivery as well as by creating social pressure. Parental responsibility for compulsory education upto age 14 is enforceable by *Gram Sabha*. Strengthening decentralisation, the Act lays down clearly the roles and responsibilities of key agencies : parents, teachers, local bodies and government. A crucial role is assigned to the PTA to be set up for every school.

The aim is to foster processes that help school emerge as a strong unit accountable to the local community of parents, with all other structures performing the role of school support institutions. Perceiving academic and administrative functions as constitutive of educational management, structural convergence has been effected at all levels of support institution for enabling holistic planning for qualitative learning outcomes.

Human resource support has been enlisted at school-level through voluntary teachers (retired) or Shiksha Bandhu. Incentive framework for teachers and students has been stipulated. Teachers are not to be normally deployed for non-teaching tasks. Private Sector has been encouraged. No prior permission required to open schools upto middle level.

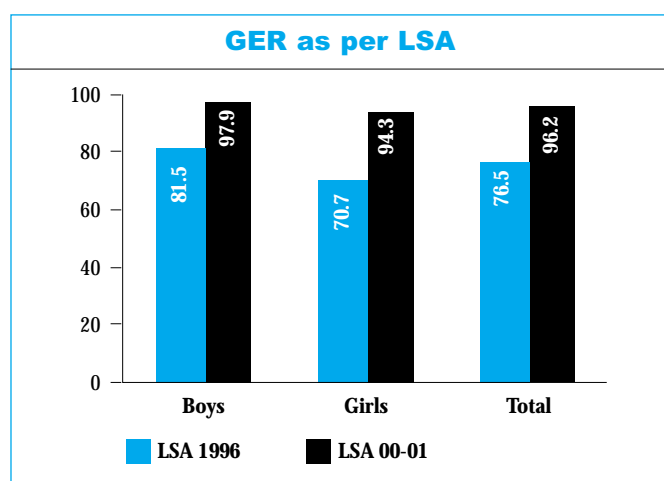

To make planning responsive to the local educational needs, a *jan shiksha yojana* emanating from the PTA level is envisaged. Educational funds at the school, district and state level designated as *shala, zilla* and *Rajya Shiksha Kosh* are to be set up for enabling mobilisation of additional resources. Public education Report (*Jan Shiksha Prativedan*) will be presented on the status of education, specially learning outcomes, every quarter to the PTA and to the District Government and annually to the legislative assembly, constituency wise. These reports are expected to feed back into the *jan shiksha yojanas* for incremental improvement; thereby creating an organic relationship between planning and evaluation, placing their outcomes in public space for reinforcing people's right and the state's responsibility for better quality education.

from 70.7 percent in 1996 to 94.3 percent in 2000-2001 clearly indicating that there has been a rise in girls' enrolment. There has been significant increase in GER of ST, which has risen from 78 percent in 1992 to 91.0 percent in 2000-2001. The gap in GER of boys and girls has also narrowed from 25 in 1992 to 10.8 in 1996 to 3.6 in 2000-2001, indicative of the fact that girls' enrolment has increased in the past eight years.

In the State, presently 82.64 lakh children are enrolled at the primary level. Out of these 37.78 lakh are girls, which is 45.7 percent of the total enrolment. The increase in enrolment is a result of a series of mobilisation activities such as Mahila Shiksha Abhiyan, which focused on enrolment of girls,

especially SC and ST girls. These resulted in the additional enrolment of approximately 14 lakh girls. The opening of EGS in areas, which were deprived of education facility, also resulted in enrolment of children, who otherwise were not enrolled in schools or were not regular in attending school because of long distances. There are 12.2 lakh children enrolled in EGS schools, out of these 5.7 lakh are girls which is 47 percent of the total children enrolled in EGS schools. Similarly the number of tribal children enrolled in EGS schools is 5.4 lakh, which is 45 percent of the total children enrolled in EGS schools.

District wise details of target population, enrolment and GER at primary level are given at *Annexure-4*.

GER as per LSA 1996			GER as per LSA 2000-2001		
Boys	Girls	Total	Boys	Girls	Total
81.5	70.7	76.5	97.9	94.3	96.2

Source: LSA 1996 and LSA 2000-2001

Enrolment in upper primary schools

The GER at upper primary level is 70.3. The enrolment at upper primary level is 23.14 lakhs, out of which 9.18 lakhs are girls. District wise details are given at *Annexure-5*.

Retention

Even while enrolments have improved the problem of retention persists. About 70 percent children survive till the primary cycle, 50 percent survive the upper primary cycle and only 40 percent the higher secondary. Although the transition rate from primary to upper primary level is 97 percent, only 50 percent of them complete the upper primary level. Girls are the biggest casualty. Proximity of the middle school is an

important factor. It is hoped that with the universalisation of the middle school, completion of the upper primary cycle will improve.

OUT-OF-SCHOOL CHILDREN

District data captured in the habitation wise household contact surveys in 1996 and 2000 show that the percentage of Out- of- school Children against the target population has decreased from 29.3 percent in 1996 to 11.2 percent in 2000-2001.

	Out -of -school children against target population LSA-I (1996)			Out -of -school children against target population LSA-II (2000-2001)		
	Boys	Girls	Total	Boys	Girls	Total
In percentage	24.4	35.2	29.3	9.4	13.3	11.2
In lakhs	13.15	16.04	29.19	6.05	7.23	13.28

Source: LSA 1996 and LSA 2000-2001

- Out-of-school Children in age group of 6–14 years are 13.28 lakh, which is 11.2 percent of the target population. *Annexure-6*
- Out-of-school children comprise of the never enrolled and dropout children. Of the total out-of-school children, the never-enrolled children are 70.7 percent of the total Out-of-school children & drop-out children are 29.3 percent of the total out-of-school children
- Dropouts at primary level are 2.81 lakh, whereas at middle level it is 1.08 lakh.
- Out-of-school girls are 7.2 lakh, which is 54.5 percent of the total out-of-school children.
- Never-enrolled children are 9.4 lakh; out of which 5.2 lakh are girls, which is 55.3 percent of the total never-enrolled children.
- Dropout children are 3.88 lakh; out of which 2.04 lakh are girls, which is 52.6 percent of the total dropout children. Broad reasons for children being out of school, either as never enrolled or drop out are as follows:
- About 80 percent girls remain out of school due to the following five reasons i.e. sibling care (24.6 percent), engaged in economic activities (18.5 percent), cattle grazing (13.6 percent), weak financial condition (13.6 percent) and migration (9.3 percent).
- About 86 percent boys remain out of school due to the following five reasons i.e. engaged in economic activities (21.6 percent), cattle grazing (22.4 percent), sibling care (15.6 percent), migration (11.5 percent) and weak financial condition (14.4 percent).
- Other factors responsible for children being out of school

are social belief and parental reluctance to send children to school, especially girls, lack of upper primary educational facilities (8.0 percent), prolonged illness or handicap (2.4 percent) and school environment not conducive (1.6 percent).

- Social belief and parental attitude is responsible for a higher girls' out of school (8.24 percent) in comparison to boys (3.1 percent). Similarly, migration affects the boys (11.5 percent) in comparison to girls (9.3 percent)

It is evident from the data above that having achieved the goal of providing access to primary education facility, the problem of out of school children still persists. This is more acute for the upper primary level. The upper primary data shows that gross enrolment ratios are low. It is expected that the opening of middle schools in close habitations will improve the transition rate from primary to upper primary. These cases require specific attention for effective interventions. It is evident that the major reasons for children being out of school whether as never enrolled or drop out across both genders are economic (75 percent). Some schooling incentives are being provided to meet the cost of some factors affecting school participation. Incentives like book-banks, free educational materials, uniforms are being provided focusing on SC/ST children and girls of economically backward families etc. subject to resources Community mobilization and making the school flexible in its operation have proved effective for increasing enrolment. Largely, however economic, health and cultural factors are exogenous to the education sector and require convergence inputs from sectors that deal with livelihood issues. Health reasons too are exogenous to the education sector and require clear targeting of health programmes.

LEARNER ACHIEVEMENT

Sample studies have been used to indicate trends in learning achievement levels.

NCERT designed tests were conducted on a sample basis in 950 schools in 19 DPEP districts between the years 1995 to 2000 for the primary level. These were the base, middle and terminal assessment test (BAS, MAS and TAS). These indicate a progression from mean achievement levels over a period of 5-6 years. From 1995 onwards; the mean achievement scores in Language moved from 46.04 percent to 75.75 percent for class I and from 31.75 percent to 60.31 percent for class IV and for Math from 40.39 percent to 76.04 percent for class I from 27.84 percent to 52.12 percent for class IV in phase I districts (from BAS to TAS). What the NCERT study shows is that while there has been a positive trend towards improvement. Nevertheless, it is a matter of concern that the achievement in mathematics by the time the child reaches class five is not more than 50 percent, and not more than 60 percent for language, creating a situation where the child would move onto upper primary with competence over only half the curriculum.

Baseline and Midterm assessment survey was conducted in 15 DPEP II districts in 1997 & 2000 respectively. These surveys indicate a progression from mean achievement levels over a period of 3 years. From 1997 onwards; the mean achievement scores in Language moved from 38.76 percent to 54.95 percent for class I and from 31.99 percent to 43.05 percent for class IV and for Mathematics from 34.09 percent to 62.07 percent for class I from 26.65 percent to 35.78 percent for class IV in phase II districts (from BAS to MAS).

Factors responsible for unsatisfactory academic achievements can be identified as being both academic and non academic. Among the non-academic factors the commonest is the absence of the teacher from the classroom mainly on non-teaching tasks, which affects the time on transaction and completion of the course. It has also emerged that a large number of children do not have textbooks. Although the state has a commitment to provide free textbooks the resources required to support this do not match the need. Among the academic factors attention needs to be given to deploying qualified teachers for appropriate tasks, the professional development of teachers, improving class room processes and learner evaluation systems and academic supervision.

EQUITY

The issue of equity is central to education both because the delivery of education should target the disadvantaged group traditionally deprived of the opportunities of education, and because education is understood as a process of empowerment. This involves a distributive aspects and a qualitative one. The distributive aspects, in terms of the spread of resources, have been measured through indicators of access and participation. Primary schools have been established within a k.m. of each habitation, with more than 50 percent of the EGS schools coming up in tribal areas. This universal spread of primary education gives every child the opportunity to access basic education. In addition there has been an improvement in the share of girls' participation in schools and the gender gap in children in and out of school has reduced. The number of girls out of school has been reduced from 35.2 percent in 1996 to 13.3 percent in 2001. Table 3 shows the reduction in the difference between out of school girls and boys from 11 to 4 percent. The Table 4 also shows the reduction in the difference between girls and boys in terms of enrolment.

REDUCING GENDER GAP IN ENROLMENT (LSA-I(1996) AND LSII (2000-01)

Indicators for measuring equity in participation are captured in *Annexure-9*

Sample studies undertaken by IIM Lucknow, on the behest of GOI also indicates the positive trend of equity indicators.

KEY CHANGES IN THE STATE'S EDUCATIONAL PERSPECTIVE

One could attempt to assess the performance of the state and the tasks ahead for it, based on the kind of policies, and information discussed above. The state has succeeded in establishing a decentralised management of education, especially primary education right up to the village level. The focus is now

on empowering the school as a unit. Issues of decentralising academic support to schools have acquired significance and structures for academic decentralisation have been created. It should now be possible to address a holistic agenda for making the school effective for quality education because of decentralisation. Key issues of quality now are getting positioned centrally. Planning now has a large database rooted at the habitation level. The issue of primary education has been lodged in a regime of rights. Rights themselves have been seen as civil society covenants not just as legalistic provisions, making the whole issue of universal education a pragmatic commitment moving towards the fulfilment of a normative vision. The understanding of community participation has deepened and this has expressed itself in different institutional forms moving from elected representative structures of the panchayat type to VEC, to collaborative structures as PTAs, to direct community participation institutions as the Gram Sabha and this has expressed itself significantly for education. This understanding of community has also influenced the perception of resources as meaning not just financial but human resources possibilities for innovative action on a large scale.

TASKS AHEAD

With the outreach of primary schools being universalised and that of upper primary also being universalised, the key agenda for the state is to focus on (a) special efforts to bring out-of-school children within the fold of education. b) improving retention completion and transition with special focus on equity. c) improving achievement levels.

This really implies a very comprehensive agenda for quality reform. The broad strategy for this would be underpinned by (a) strengthening organic bonds between the school and the community by enhancing school accountability to the local community and ownership and support to the school by the community, (b) improving academic inputs through decentralised institutional reform, content enrichment, evaluation reform and capacity development, (c) capacity development of educational management personnel by reorienting towards school as unit, retraining on working with community, professional development of necessary skills, like information analysis, planning and monitoring, problem solving and remedial action.

Thus, the challenges that MP has are improving the quality of education, bringing back the still out of school children to school, and improving retention in the whole school cycle.

Focus on children-out-of-school

A clear focus is now required on out of school children i.e. the never enrolled and drop out categories. District specific data is now available with the districts for decentralised planning for child specific targeting at the local level. These districts require special focus. However, an interesting feature is that the out of school factors are more or less similar in all districts in their

character and relative significance when viewed at the district level. This suggests that variations of critical significance would occur not only at the inter district level or regional level, but actually substantively at sub district levels, possible in pockets or among specific social or economic groups. This indicates the need for further decentralisation of planning below the district to the habitation/ village/ gram panchayat and school cluster levels where child-specific, family-focused targeting is possible. The newly instituted gram swaraj provides the framework for such habitation specific planning. In this context setting up Parent Teacher Associations (PTAs) and mobilising PTA and VECs through capacity development programmes and control of resources as well as decision-making could be a major strategy for child wise tracking. The PTA would also have the power to determine school timings and holidays in order to make school responsible to be local cultural and livelihood requirements. The PTA would be encouraged to raise resources locally so that child specific interventions can be given to out-of-school children.

Decentralisation and community control over development processes makes possible inter sectoral convergence needed to address, health and socio-cultural factors effecting children's schooling. Decentralisation can facilitate convergence to ensure health services for all the children. Moving toward decentralised management for Health care, the State Government has launched a scheme called Swasth Jeevan Sewa Guarantee Yojna. The scheme aims at improving the status of rural health care by ensuring the provision of basic determinants of health: safe drinking water supply, sanitation, nutrition, immunization, ante-natal care, training of the local health workers. Convergence with this scheme would enable better targeting of better health enabling services for children. Mid day meals could prove to be an effective incentive especially for children belonging to families of low economic status of the effective use of MDM gets monitored by PTA and for ensuring its timely distribution to the children. Convergence can also be sought of programmes of women empowerment. Convergence with programmes of self-help groups to some extent would also help in addressing economic reasons influencing enrolment and attendance.

The main challenge for MP is the education of the poor children. Despite the universalisation of access, and increase in the provisioning of infrastructure and teachers, the problem of retention, substantial reduction of drop out and improved learning levels for all children remains. In rural government schools there are clear indications that poverty has a negative effect on all key educational indicators. Empirical observations and the data available shows that among the first generation learners, children with low health and nutrition levels, or who support the family tend to be the ones whose attendance therefore is irregular, and whose participation in school processes tends to be conspicuously inhibited and slow. The education of poor children requires pedagogic innovations,

flexible academic structures for schools, and teachers with a strong empathic commitment to working patiently and perseveringly. Since the school is a social institution, besides free text books, free uniforms, and a mid day meal would help encouraging the participation of poor children.

The issue of out of school children needs to be seen not only as a back to school programme but is intimately linked with the retention of children in the completion of a whole school cycle. Completing school with a school certificate besides allowing transition to higher education gives a definite advantage in the employment market and in opting for other avenues of skill acquisition. Therefore, one of the factors that hold attraction is the prospect of a school completion certificate, and this needs to be made to appear possible for all. The challenge here is double fold: Retain the children in school at the primary level to complete the whole school cycle, and to enroll and retain the over-age children who are late starters to complete the whole school cycle. The implications of this involve a wide range of action. First, attention to the whole school cycle would have to be given, and universalisation of elementary education would have to be seen not as an end in itself, but as creating the prerequisite condition for it. Thus, while prioritising primary and elementary stages may have a justification both as historical beginning points and in resources, nevertheless as the state works on the elementary stage, it would be manifestly evident that not looking at the whole school cycle would mean the persistence of basic problems of low social motivation specially among the poorer classes to take the steady schooling of their children seriously. In the social perception it is the whole school that has value, not an interim stage in it. Therefore, even while the state is planning universal elementary education, it has to start addressing the issue of high school access in a way that makes the opportunity of school completion a possibility for all.

For overage children, especially overage girls, on the adolescence threshold, special methods would have to be thought of to facilitate their enrolling and transiting through to complete the school cycle. This will require the development of materials and methods that facilitate swifter paced transition by the overage late entrants to the school and helps them complete their school cycle in a shorter duration. A feasible approach here would be to tap the potential of the state open school and to develop systems of Equivalence. This would benefit the fifteen plus youth that enlists in the adult education programmes, as well. As the state expands its reach, the hard to reach groups tend to become increasingly more visible, and the need to strengthen the open school and equivalence systems becomes increasingly more central in view of the fact that the gap in the literacy base would remain unless opportunities for completing a full school cycle are restored to this group that has missed the right age for enlisting in school.

Improving the quality of learning at the primary level

Returning children to school with the objective of enabling them to acquire education of satisfactory quality demands an in depth and comprehensive agenda of quality reform. Improving quality of education needs focus on institutional reform, better classroom processes, need-based teacher education programmes, curriculum and evaluation reform and emphasizing processes of lateral accountability and improving educational quantities.

Enriching the quality of classroom process

A challenge common to all schools is the different levels of abilities among children and often in the same child in either different subjects or different times depending on the quality of his participation. Madhya Pradesh was able to evolve a range of pedagogic practices that highlight the possibility of making class room processes more meaningful through organizational strategies that balance flexible groups and normative grades. These can help respond to. This requires both continuous teachers training, development of appropriate TLM to diversify the linearity of the text and most significantly, policy support to flexible school structuring principles. While these pedagogic methods are important for all good schooling, they are most critically needed for contexts of first generation learners or mixed age, mixed ability heterogeneous groups characteristic of chronically deprived areas and communities. The state need to build upon its nascent insights and experience of these pedagogies of learning focussed on multiple levels. The use of IT has been viewed as a potential medium for pedagogic transformation, creating ground for interrogation, choice, self-learning. It should be continued in this direction with greater integration with classroom process, expansion of the horizon of knowledge, and greater stimulation to self-learning.

Strengthening teacher education

Assessment of learning levels at the primary and upper primary both indicate the need to focus on the development of foundational competencies in Mathematics, Language and Science. There is a need to develop teacher capability both through the induction and in-service training programmes of teachers. Special emphasis will therefore have to be placed on improving teacher capability in transacting Mathematics and Science curriculum. This should be done through need-based programmes focusing on specific content and pedagogical areas. The process of using distance education, computer enabled education and school libraries as Alternative Learning Sources (ALS) for teacher and students development should be further supported and expanded. Distance learning programmes need to be continued.

Improving learner evaluation processes

It needs to be ensured that learner evaluation will be not just a test of basic text based competencies but also a process of

appraising the quality of teacher-pupil interactions and the overall cognitive development of the learners, handling the individual differences positively. A balance has to be maintained between individualism issues and normative standardisation, which will also help keep evaluation from becoming threatening. Lateral accountability of the school to the local community for learning outcomes needs to be clearly established to elicit parental support for improving the quality of learning. The results of quarterly evaluation need to be shared with the VEC and PTA at the village level successively to the Panchayats and District Planning Committee to ensure regular monitoring of learner achievement by them.

Maintaining an efficient Teacher-Pupil Ratio

Provision of additional teachers both at the primary and upper primary levels in order to maintain the TPR at 1: 40 on the basis of rationalisation and reallocation, to improve the quality of classroom transactions. An efficient TPR is necessary for effective teaching learning processes. The current situation on multi grade teaching is very clearly contra indicative to quality transactions. Inadequate attention to evaluation, failure to undertake diagnostic and remedial action, negligence even in simple routine tasks like completion of textbook based exercise can be clearly traced to high TPR multi grade situation, wherein teachers do not have enough time to focus on child specific tasks. As a consequence, the result of multi grade teaching or large class sizes is the un-noticed perpetuation of errors militating against all inputs into mastery level competencies, it is evident that while an efficient TPR is the principle condition of quality teaching learning, nevertheless, it is also equally susceptible to availability of resources. Efforts should be made to move towards a more efficient TPR beyond a 2 teacher per school primary norm and 3 teachers per school upper primary norm on the basis of a realistic assessment of students' attendance patterns and teacher availability and specific academic requirement especially at the upper primary levels. A current estimate of additional teachers is based on the current estimate of TPR. School specific TPR can be improved through teacher reallocation, but if the average TPR has to be brought to 1:40, then additional teachers will be needed.

Striving for a holistic view of quality

The issue of quality is often limited to academic inputs and outcomes. Thus, there has been a demand for B.Ed/ D.Ed/in service trainings and a great emphasis on text book revision. What has been difficult to explain has been a widely prevalent situation where teachers with desired professional qualifications, and refresher trainings and improved text books and pedagogies still do not generate effective teaching learning processes and the desired results. The inadequacy of a pre determined criteria of academic inputs seen in isolation from other historical contingencies becomes glaringly obvious in such commonly prevalent cases of quality default. A number

of studies conducted show that apart from a prescribed qualification criteria, intangible attributes like empathy and sense of responsibility are necessary for a teacher to perform effectively, and that without these, even highly qualified teachers do not teach even by minimal standards of satisfactory transaction. Yet these are rarely factored in the way the teacher has to be recruited, or trained or even assessed and these pose a challenge for designing a criteria for the teacher's professional development. Issues of teacher empathy with the students coupled with clearly defined accountability of the teacher to the parents whose wards are in his charge become very significant in a state like Madhya Pradesh where the children whose education really poses a challenge to the state are from economically deprived families.

Issues of accountability, incentives or the effect of general levels of social awareness offer themselves for consideration. One of the realizations in the process of decentralised management is the need to look at the whole context for understanding quality. The context would imply the school and its academic inputs and their relationship with each other, the school and management practices and policies that define it and would also imply the school and its relationship with the social community within which it functions. Quality then would have cognitive, infrastructural, managerial and social dimensions and would derive from the relational nature of these dimensions. This understanding has determined the way in which issues of quality are being sought to address. One effect of this whole context perspective is that it places the issue of curriculum reform within the larger frame of educational reform. This alters the conventional way of posing questions on quality that start with just the academic inputs, assuming that the other factors are administrative or 'physical' or pertain to the community and outside the core issues of academics that actually determines quality. A holistic approach to educational reform on the other hand recognizes the need to transform the context in which the text has to be transacted. The present level of quality in the state then is the result of the present relationship between the academic, and social factors and the institutions of political democracy.

Thus, the state has planned for an intensive training of all the teachers, and curriculum review, and strengthening teacher education and academic support institutions. This is accompanied by a commitment to establishing social accountability of the school. The Jan Shiksha Adhinyam aims at creating processes towards social accountability for quality. For this the PTA and the VEC are seen as key institutional arrangements. The People's Education Report to be instituted annually is expected to make the Government accountable for quality. The empowerment of democratic institutions and processes for creating accountability of school performance is expected to give a critical edge to the issue of quality. Empowerment here implies both the creation of structures and focused efforts to develop capacity. This is why the state has given serious

attention to the adult education programme, through its Padhna Badhna Andolan and its Padhna Badhna Sanghs that are in the making to consolidate and institutionalize the energies and build capabilities of such sections of the community who depend on the public education system. The objective here is to continuously increase the capacity of the community to create as well as to demand better services for themselves. Finally, since quality is seen to be a relational process of multiple factors, the approach towards improving quality emphasizes an intensive broad based participatory research strategy that does not abstract single strands for study like academics, or community or management, but strives for a holistic perspective. Such an approach also rejects the notion of quality as only a technical, supply side issue and sees it evolving through a dialogic process of all participants. This conceptual analysis of quality provides the framework of action presently initiated by the state for educational reform. Such action is at a very nascent stage and would have to be sustained through careful planning and evaluation in the time to come.

Improving physical infrastructure

Physical infrastructure in schools will be improved through the provision of buildings, additional classrooms, toilets and drinking water facilities. Currently, there is a gap of 23387 primary school buildings, 36668 additional rooms, 6287 schools require major repairs and 9426 schools require minor repairs. District-wise details of infrastructure gaps are given at Annexure-3(i), (ii), (iii). Convergence of resources is being planned to mobilise support for filling in infrastructure gaps.

Improving School Management through decentralisation and capacity development

The complex nature of UEE demands that the greatest attention be paid to the process of planning and implementation, institutional reform, and convergence of resources. Again, in view of the complexity of the problem, decentralisation will have to be the key defining principle of the educational planning and management. Decentralisation has been a key strategy for improving school quality by making management accountable to stake holders. The effort is to establish school as a unit responsive to the learning needs of the children and the educational aspirations of the community. The process of decentralisation of educational management has culminated with the establishment of PTAs and VECs as statutory institutions devolving power on the community to control the local schools as well as to support it in its basic requirements. Similarly the process of academic decentralisation has been initiated with the establishment of Cluster Resource Centres (Jan Shiksha Kendras). Attention needs to be given to strategies for strengthening these decentralised institutions through internal restructuring along with professional capacity development. Formation of decentralised management structures right upto the grass root level has an implication for the need

of capacity building at all levels. Capacity development and strengthening infrastructure support to these decentralised integrated units is needed to enable them to function effectively. All VECs/PTAs will be oriented towards their school management roles. The training focus will be on the role of VEC/PTA in micro planning and implementation of Village Education Plans, effective use of school contingency, monitoring, progress of children in schools.

EQUITY: IMPROVING EDUCATIONAL OPPORTUNITIES FOR SPECIAL FOCUS GROUPS : GIRLS, SC, ST

Gaps in girls' participation at the primary and upper primary levels have been assessed and collected. Also the census data of 2001 clearly indicates the district, which requires special attention because their literacy status is below that of the State average and the female literacy rate is also very low. A clear problem area is the education of girls in the age group 11 upwards, who have never enrolled in schools. They need specially designed and planned education programmes to enable them to enlist and complete their education. Making the school timings and holidays flexible makes the school more inclusive and while the power to do so has been vested in the PTA, it needs to be consciously and sensitively emphasized and ensured. Non-grade, group based pedagogic practices, bridge-materials in a self learning mode allowing transition and completion at learner pace would enormously increase the chances of these children who tend to form the bulk of the vulnerable category of drop out or never enrolled. The open schooling system which is essentially a system for flexible learning reaching out to learners regardless of their age needs to be remoulded to serve this purpose. Efforts need to be made to encourage women to enlist as teachers especially at the upper primary level. Provision of separate urinals for girls is also expected to have a positive impact on girls' retention both at the primary and upper primary level. Social mobilisation and convergence with programmes of women's empowerment and especially with Continuing Education programmes will prove to be effective. Appropriate incentives such as scholarships, uniforms, free teaching learning material need to be designed to target needy children of special focus groups.

In Summary, the action ahead has to take the following issues into consideration:

- Provision of appropriate infrastructure facilities to schools.
- Focusing on strengthening institutional management processes and strengthening the use of information for planning and management
- Strengthening decentralised management through capacity development
- Strengthening community participation especially through institutional means such as the PTA and the VEC.
- Sustaining the new impetus towards restructuring

academic support systems on principles of professional calibre, school experience as participatory forum of teacher development and motivation, especially at the level of the Jan Shiksha Kendra.

- Adopting a more developmental approach to teacher training, and creating professional incentives for teachers to upgrade their knowledge and skills.
- Ensuring that the curriculum both respects local knowledge and culture and adds wider dimensions of understanding and accordingly effect improvement in content.
- Establishing a reliable system of learner assessment.
- Develop appropriate incentives for learners mainly of special focus groups
- These measures have been initiated. They need to be sustained and strengthened in the light of experiences and in the interest of learners.

The key theme is to continue decentralising management and academic support to schools so as to redefine the school from its inherited identity as the lowest level appendage to large bureaucratic machinery to school as empowered and autonomous unit.

RESOURCES

Resources required for UEE have to be estimated first on a needs basis. The extent to which the resource gaps are met, will be subject to the availability of resources under different programmes. Therefore resource-based estimates also need to be drawn up. The state has drawn up Education for All (EFA) plans projecting needs, proposing strategies and estimating resources for both elementary and adult education. The EFA plans estimate approximately 8,500 crores will be required for fulfilling all the needs and providing free elementary education to children. A major programme for planning and mobilizing resources for implementing the elementary education strategies is Sarva Shiksha Abhiyan (SSA).

A significant strength of the planning emerging in the state is that it seeks convergence of schemes. SSA is an effective vehicle for this convergence. This internal convergence of educational schemes and resources will itself enable comprehensive planning with optimum utilisation of resources. The state expects all 45 districts will be covered under the SSA. Perspective plans for a five-year period have been submitted to the Government of India. 12 have already been sanctioned. The process of upgrading DPEP into SSA in the remaining districts is in process and it is expected that by end- 2002 all DPEP districts would move into the SSA mode. This will mobilise additional resources for universalising elementary education.

However, it needs to be mentioned quite clearly that resources through specific programmes are additional. The main share of finances come from the state's own support resources. The state has therefore to seriously review and reformulate its own financial investments in the education

sector to optimise their benefits. Some options that the state has are:

Reducing administrative expenditure at state level institutions

This is long pending since decentralisation really does allow a thinning down of top-level structures because their powers and functions have been devolved. This is needed not just for cutting out redundant financial expenditure, but most urgently for liberating the new empowered decentralised arrangements from the hegemonic with then influence of top structures with their historically inherited authoritarian cultures.

This would also imply administrative efficiency. As an interim measure, state level personal could be allocated at district and sub district levels where work functions would tend to acquire a greater responsibility because of greater autonomy. Over a period of time administrative overheads should be rationalized to liberate more resources for programmes. Secondly, there is a need to closely scrutinise and understand choices on the basis of a cost - benefit analysis, to adjudge cost effective inputs.

The state has been wrestling with the problems inherent in universalisation: needs versus resources, commitment to universalisation and concern for quality, time- bound action and the necessity of resource-based, phased planning, standardization of norms and pervasive differences and disparities. Looking to the different types of teachers schools and related incentive systems it could decide upon the most cost effective inputs. Setting performing norms itself can ensure effective returns on current investment without incurring additional expenditure. This could imply for example, setting eligibility criteria for the placement of personnel and teachers and according to the needs of the institution and performance norms as incentives or disincentives. Capacity development would enable optimising the impact of available resources by improving internal efficiency. This would include retraining in newer skill requirements, structural reorganization and integration on the principles of decentralisation would reduce stagnation and wastage on top and encourage accountability at school/closer to school levels. Convergence of programmes on a comprehensive intra and inter-sectoral needs will reduce duplicate/parallel efforts and costs. Empowering communities is the most effective the most cost-effective way of meeting the complex challenges of education. Ownership can help improve the school even with limited resources in a partnership framework, which the Madhya Pradesh government has been pursuing. Finally it would help to look at the school as an evolving process balancing a pragmatic strategy and normative frame.

Creating a legal frame for educational reform

The state government has formulated a legal frame for consolidating and promoting the initiatives for educational reform

through its Jan Shiksha Adhiniyam-which seeks to strengthen the institutional partnership between the Government, the local bodies and the community in the task of universal elementary and adult education. The Act has been passed by the state Assembly for implementation in the State.

ADULT EDUCATION

Adult Education has been an area of key concern, both because basic literacy to all is a commitment of the state, and because there is a clear reciprocity between the educational status of children and the adult community. The key strategy for this in Madhya Pradesh in the first half of the decade of the 90s was the Total Literacy Campaign (TLC) sponsored by the Central Government. Under this all the districts in Madhya Pradesh implemented the Total Literacy Campaign (TLC). 54.10 lakh were made literate over 9 years. But by mid-90s there was a need to review the TLC strategy.

The major change made against the movement for total literacy was that it is unable to excite the adult community whose children did not go to school because they lacked the facility. That was what led observers to lament the literacy campaign as an effort to mop the floor with the tap open. The synergies in the relationship between the efforts for universal primary education and mass literacy needed to be realized.

The primary education base supported action for adult education. EGS through its wild fire spread took the message of education for all into all habitation in Madhya Pradesh so that when subsequently the Padhna Badhna Andolan was started for literacy in late 1999 there was a torchbearer for education in each habitation and a community that had participated in creating a learning environment for their children.

Padhna Badhna Andolan (PBA) was Madhya Pradesh's programme to revitalise the literacy movement in the state. PBA differentiated itself from the prior literacy strategy of the National Literacy Mission (NLM) (the Literacy Mission of the Central government) by emphasising collectivity, demand, local choice and incentive to the literacy volunteer. The programme undertaken for a year in 2000 had the following key elements.

- Non-literates would come together as *Padhna Badhna Samitis*
- They would chose local educated person to be their teacher (*Guruji*)
- They would register at the nearest Panchayat or *Jan Shiksha Kendra* (Cluster Resource Centre) their names and that of the proposed *Guruji*
- Government would verify the status as being non-literate provide the *Guruji* training and teaching-learning material.
- Three basic literacy primers of the NLM would be transacted.
- In addition to the 3 literacy Primers of NLM, a fourth Primer (*Choutha Primer*) was developed by the Rajiv

Gandhi Mission on Rights (land rights, gender rights, forest rights, labour rights, development rights etc). The idea was that as the PBA Samiti transacts the Fourth Primer it repositions itself as a Self-Help Group and then a thrift and credit society.

- The Government would monitor hand hold and undertake a 100 percent external evaluation of the learners.
- Based on the number of people who cleared the examination the *Guruji* would be given a *Gurudakshina* of Rs 100 per learner to which the community was also free to add.

So if a *Guruji* made 20 people literate he/she would get Rs.2000 as *Gurudakshina* from the people he has taught. This money was made available by reducing other costs on supervision, having full-time literacy employees etc. It would be in order here to compare the physical achievement as well as costs under the two strategies of National Literacy Mission's Total Literacy Campaign and Madhya Pradesh's *Padhna Badhna Andolan*.

The hypothetical Rs. 65 per learner of the National Literacy Mission's Total Literacy Campaign becomes almost Rs. 230 because of protraction yet had no incentive for the

examination which was conducted openly with invitations advertised in newspapers requesting the public to witness the event. Results of external evaluation by expert panel approved by NLM are close to those of the 100 percent state level evaluations corroborating the results of this one-year campaign.

OF THE SAMITIS,

The Rajiv Gandhi Shiksha Mission had also invited the evaluation teams of the NLM to this event and their findings corroborated the results of this one-year campaign, which was finally vindicated when the Census results were announced. 57000 *Padhna Badhna Samitis* have repositioned, as Self-Help groups with savings of Rs. 4 crore and over 70% of these are groups of women..

LITERACY IN MADHYA PRADESH

The sections above have discussed the issues and parameters of education, and of the efforts at achieving and ensuring universal elementary education. The last seven to eight years have witnessed sustained action towards educating people in the state, making children and adults literate, bringing children to school and ensuring that they remain there, and that they receives quality and useful education. It is extremely difficult to be able to measure or assess progress of level of development of people in education. The only universally acceptable and appropriate measure is literacy, although that itself does not really tell us about the depth and quality of education levels of people. Nevertheless, it is an indicator that shows the current spread and reach of basic ability in education and perhaps also shows the expanding and deepening education in people.

The Census of 2001, gives us figures of literacy that enable us to make some assessment of the impact of all these efforts on education levels of people in the state, especially when we compare the literacy levels from previous census data.

Madhya Pradesh has recorded an unprecedented jump of 20 percent in literacy in the period of the nineties as reported in Census 2001. The work in the nineties was in the combined State of the then Madhya Pradesh that included the new State of Chhattisgarh. Taken together there has been a rise of 20.45 percent in the decade of 1991-2001 in literacy in Madhya Pradesh. The key features are :

- Undivided Madhya Pradesh records the highest decadal growth in the period of the nineties. As against a 10 percent growth in the decade of the eighties in the state, over 20 percent growth is recorded in the nineties. As far as the new state of Madhya Pradesh is concerned, there was a rise of 19.4 percent.
- The growth in Madhya Pradesh in literacy far exceeds national growth rate in comparative terms. In fact the growth rate is more than double of the national growth

Table 5

Strategy	Target	Achievement	Duration	Per Learner Cost
Total Literacy Campaign	125 lakhs	54.10 lakhs	9 years (1990-1999)	Rs. 229.55
Padhna Badhna Andolan	51.83 lakhs	29.85 lakhs	1 year (Dec 1999- Dec 2000)	Rs. 150.25

Source: Rajiv Gandhi Shiksha Mission, Government of Madhya Pradesh, Bhopal

teacher. In the case of the *Padhna Badhna Andolan*, out of the Rs.150. 25 per learner cost, Rs 100 per learner has been the component of the *Gurudakshina*. Interestingly post-evaluation encounters showed that the incentivisation was responsible for the wide popular involvement of unemployed educated youth as *Guruji*s as they went through the campaign, the moral charges of leadership was a far greater incentive than the money given as *Gurudakshina*.

Padhna Badhna Andolan was crafted to revitalise the literacy movement in the state. The response was phenomenal as over 2,17,000 *Padhna Badhna Samitis* enrolling 5.18 million came up. There was no restriction on who could be a *Guruji* and even grassroots level functionaries like *Guruji*s of EGS schools, erstwhile TLC volunteers could also become *Guruji*s of the *Padhna Badhna Andolan*. The final evaluation was scheduled between 7-9 December and out of the 51.83 lakh people enrolled 32 lakh had completed the Third Primer (another 19.41 lakh had completed the second Primer) and took the examination. 29.85 lakh cleared the

rate. At the national level literacy rate grew from 8.64 percent in the eighties to 13.17 percent in the nineties indicating a decadal increase growth rate of only 4.53 percent whereas in Madhya Pradesh, literacy grew from 10.4 percent in the decade of the eighties to 20.45 percent in the decade of the nineties indicating an increased growth rate of 11 percent. This jump is significant.

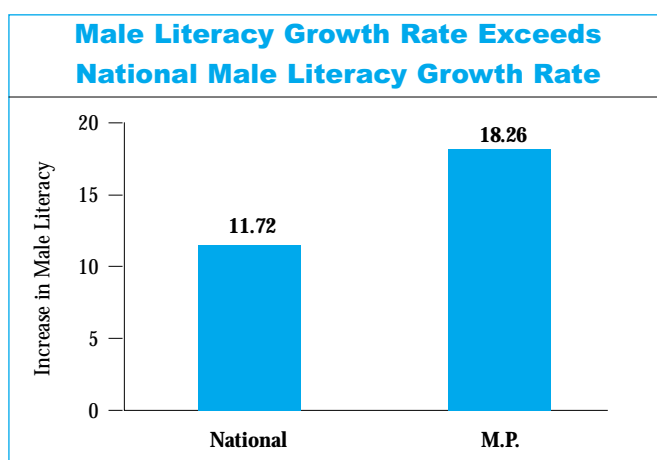

- Madhya Pradesh condenses the development of three decades into one decade. In the decades of the nineties Madhya Pradesh records a jump almost equalling the total of the three decades of sixties, seventies and eighties. In three decades preceding nineties (61-91) female literacy grew by 20.47 percent. In the decade of the nineties (1991-2001) it grew by 20.93 percent.
- More than one person out of six persons removed from the category of non-literates in India in the decade of the nineties is from Madhya Pradesh. Madhya Pradesh taken together with Chhattisgarh account for 17.94 percent of the decadal decrease in illiteracy in India.
- Taken together with population figures, out of the decadal decrease in number of non-literates in India of 3,19,58,336, Madhya Pradesh together with Chhattisgarh account of 57,30,327.
- The net reduction in number of female non-literates is 10 million of which the then unified state of Madhya Pradesh accounts for 2.2 million. Almost one out of every five women removed from the category of non-literates was from Madhya Pradesh.
- Madhya Pradesh (again taken together with Chhattisgarh as it was a common state in the decade under review) a state with a considerable backlog in the area of literacy does better than Andhra Pradesh, Uttar Pradesh, Rajasthan, Bihar, Orissa and Jammu and Kashmir. In male literacy it goes ahead of the national average and the states mentioned above as well as Karnataka.
- In summary Nineties become the defining decade when MP leads by 20 percent to catch up with the national average and shed its "Bimaru" tag.

MADHYA PRADESH CLOSES THE GAP

Literacy is catching up with national average. While in 1991, the literacy rate of the new state of Madhya Pradesh was 18 percentage points below the national rate, today it stands neck to neck (64 percent to 65 percent).

Male Literacy

- In the period 1991-2001, male literacy in Madhya Pradesh increased from 58.54 percent in 1991 to 76.80 in 2001 indicating an increase of 18.26 percent.
- Madhya Pradesh has moved ahead of the national average of 75.85 in male literacy and is ahead of the two southern states of Andhra Pradesh (70.85 percent) and Karnataka

- (76.29 percent, marginally lower) in male literacy.
- At the national level the growth rate in male literacy has been 11.72 percent, 42 out of 45 districts in Madhya Pradesh exceed the national growth rate in male literacy (the only exceptions being Indore, Gwalior and Bhopal).

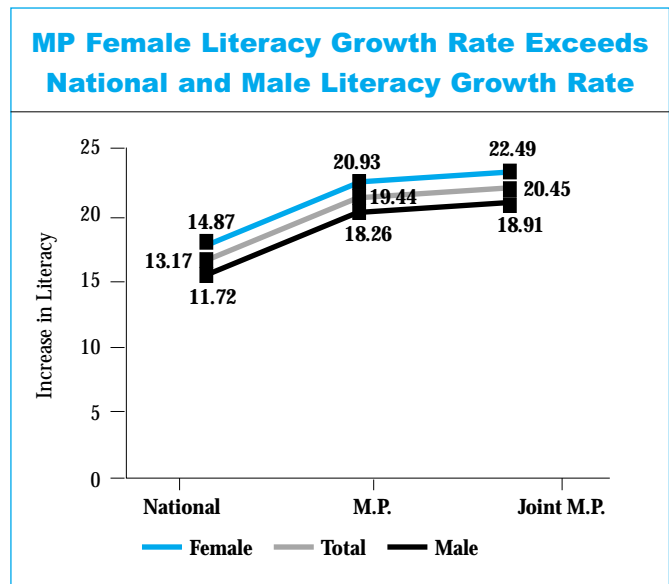

Female Literacy: Condensing three decades growth into one decade

In female literacy, Madhya Pradesh has condensed the growth of three decades into one decade. Taken as a combined state, the growth in female literacy has been 22.49 percent in the decade of the nineties. Female literacy was 8.88 in the 1961 Census, the first Census after the formation of the state of Madhya Pradesh. It grew to 13.93 in 1971, to 19.00 in 1981 and to 29.35 in 1991 making the combined growth in the 3 decades equal 20.47 percent. Against 20.47 percent growth in 3 decades, in the decade 1991-2001, Madhya Pradesh female literacy went up by 22.49 percent in the combined state and by 20.93 percent in the new state of Madhya Pradesh.

DECADAL INCREASE IN FEMALE LITERACY

This graph shows the impact of the period of the nineties on this vital development indicator.

- Female literacy growth rate exceeds male literacy growth rate and it goes from 29.4 percent in 1991 to 50.3 percent in 2001 registering a 20.9 percent growth.
- The growth in Madhya Pradesh in female literacy far exceeds the national average. At the national level female literacy went up from 39.3 percent in 1991 to 54.2 percent in 2001 registering a 14.9 growth whereas in Madhya Pradesh the growth has been 22.5 (combined) and 20.93 (after division).
- It is for the first time that the growth rate of female literacy in Madhya Pradesh exceeded the growth rate for men and the national growth rate in female literacy.
- 39 out of Madhya Pradesh's 45 districts have a female literacy growth rate above the national female literacy growth rate of 14.87 percent.
- In 17 districts in Madhya Pradesh female literacy rate exceeds the national average of 54.2 percent whereas in 1991 only 6 districts in MP had a growth rate above the then national average.
- A few miracles in female literacy in Madhya Pradesh: In three districts -Datia, Shajapur and Raisen – female literacy rate growth ranges between 35-38 percent. The story of female literacy in 3 districts is shown in Table 6.
- In 22 districts female literacy rate went up more than 30 percent.
- For the first time, the gender gap between male literacy

District	1981	1991	2001
Datia	15.13	24.45	62.48
Shajapur	11.38	19.77	57.58
Raisen	14.66	25.47	61.89

Source: Census of India, 2001

and female literacy started to decline in the decade of the nineties. The reduction in the male to female literacy rate is plotted in the graph.

Probing Deeper into Some Districts

- Districts with larger Scheduled Caste Population do better in literacy growth
- Scheduled Caste populations constitute over 16 percent of Madhya Pradesh population. How have the districts with large scheduled caste populations done in literacy in the decade of the nineties?
- As may be seen in Table 7, 14 out of 19 districts with above average population of scheduled castes have a growth rate in literacy exceeding the state average.
- All these districts have a growth rate ahead of the national growth rate in literacy of 13.17 percent. Only two urban districts Gwalior and Indore which though they have a

higher than state average of population of Scheduled Caste also have a relatively higher literacy rate of 69.79 and 74.82 respectively have logged a lower growth rate than the national growth rate.

- Districts with larger than state-share of Scheduled Tribes also do well in literacy in the nineties
- Madhya Pradesh has a population of over 20 percent Scheduled Tribes after the division of the state. 13 districts (of 1991) have a population of Scheduled Tribes exceeding 20 percent of the population.
- Here again 8 out of 13 predominantly tribal districts far exceed that state average and national average in the growth rate of literacy between 1991-2001. Only the districts of Barwani, Dindori, Dhar, Khandwa and Jhabua have a growth rate below the state average. All these five districts however have a growth rate above the national average.

Gap between Male and Female Literacy in MP

CHALLENGES AHEAD

The challenges in Adult education are sustaining and consolidating the nascent literacy skills, linking literacy with life needs, and above all promoting women's education. Mahila Padhna Badhna Andolan was launched on 8th March 2002 to cover the female literacy gaps still remaining. It is expected that the Mahila Padhna Badhna Andolan will cover the remaining gap of 50 percent illiterate women. Under MPBA, 1.73 lakh Mahila Padhna Badhna Samitis have been formed and 35 lakh illiterate women have forwarded their demands to be made literate. Out of these 29.64 lakh women have been enrolled in the Mahila Padhna Badhna

Table 7

Selected Districts with SC Population above state average	% of Scheduled Caste Population in district	% Literacy in 2001 Census	% of growth in literacy between 91-2001 (against State Growth 20%, National Growth 13%)
Datia	24.67	73.51	28.32
Bhind	21.34	71.22	21.99
Morena	19.89	65.58	19.65 (Sheopur 20.06)
Rajgarh	18.00	54.05	22.24

Creating a Social Action Group in every village: Padhna Badhna Sangh

Padhna Badhna Andolan with its 0.217 million *Padhna Badhna* literacy volunteers generated social energy even in remote rural areas that needed to be consolidated and strengthened. The nascent bonding for shared agenda seeded through a *Padhna Badhna Samiti* is sought to be captured in the form of village based Social Action Groups. The Social Action Group or the *Padhna Badhna Sangh* is conceptualised as a federation of the local *Padhna Badhna Samities*. The *Padhna Badhna Sangh* or the Social Action Group is a collective of the *Gurujis* and the adult neo literates.

The key components around which Social Action Group activities are to be organised include :

- Mopping up residual illiteracy and consolidating neo-literacy skills.
- Income generation activities: *Padhna Badhna Sanghs* as self-Help Groups can develop projects for economic activities and field it to the district -level which could support this activity and also leverage other development funds.
- Cultural activities like setting up of Libraries: The state has set for itself a target of 51508 rural libraries to be established by the beginning of 2003. The effort is to give each library a television, radio and a public address system in addition to books, periodicals and newspapers and sport facilities. The community and the local administration

will arrange the space for the library.

Each *Padhna Badhna Sangh* will select an animator or a "Prerak" who will lead the group. The literacy volunteer who has made the maximum number of persons literate in the *Padhna Badhna Andolan* would be chosen as the animator or *Prerak* of the Social Action Group.

The *Prerak* would be eligible for an honorarium for action under a six point charter : (a) managing the library (b) ensuring that every child is enrolled and retained in school, (c) every women in the village is made literate, (d) households are motivated for water conservation under the *Pani Roko Abhiyan* of the state government, (e) motivating households to adopt sanitation practices, and (f) conducting house-to-house campaigns for removal of untouchability. Based on the report of work done, an honorarium of Rupees six thousand will be made available to the *Prerak* after every twelve months. The *Prerak* thus takes the responsibility of activating the *Padhna Badhna Sangh* towards collective social action and cultural development. The training of the *Prerak* becomes a critical issue to be addressed on priority. The Shiksha Mission has planned for institutional development of these *Padhna Badhna Sanghs* by linking them up for capacity building by institutions engaged in social and cultural action.

Table 8

District	Population of ST in district	% of Literacy in 2001 Census	% growth in literacy
Jhabua	85.67	37.08	18.07
Mandla	60.84	60.77	23.75
Dindori	60.48	54.49	16.75
Umaria	54.84	60.26	27.63
Shahdol	46.32	57.76	22.31
Dhar	53.48	52.70	18.16
Khargone	46.23	63.41	22.18

classes. The fourth Primer has been revised to make it sensitive to gender issues so that it becomes relevant to the women literacy groups.

Institutionalising the literacy energies to create a sustained base for continuing education is the major task at hand. This is expected from the Continuing Education (CE) programme of the NLM. A Continuing Education Project for each district has been formulated. Out of 45 districts 19 districts have received approvals and the remaining are expected to be cleared shortly. Work under CE has started, addressing issues like mopping up residual illiteracy in the form of *Mahila Padhna Badhna*, strengthening self help groups, and developing neo literate materials. Establishing a network of rural libraries and *Padhna Badhna Sanghs* are the key elements of institutionalisation that are expected to move literacy efforts towards Continuing Education that helps in improving the quality of life.

ANNEXURE-1: STATUS OF ACCESS AT PRIMARY LEVEL

S.No.	Name of the District	Number of Govt. Primary School	Number of EGS School	GAR
1	Betul	1565	433	100%
2	Raisen	1279	526	100%

ANNEXURE-8

"DEFINITIONS

Equity

Equity Index of participation (Enrolment) : Equity in terms of share of target group in Enrolment as against share of target group in population."

Equity Index of Participation Enrolment as per Lok Sampark Abhiyan - II (Year 2000) data

Tribal Equity Index	=	$\frac{\text{ST as \% of total Enrolment}}{\text{ST as \% of Target Population}} \times 100$
Gender Equity Index	=	$\frac{\text{Girls as \% of total Enrolment}}{\text{Girls as \% of Target Population}} \times 100$
Social Equity Index	=	$\frac{\text{SC+ST as \% of total Enrolment}}{\text{SC+ST as \% of Target Population}} \times 100$

Gross Enrolment Ratio (GER)

GER Primary	=	$\frac{\text{Enrolment Class 1 to 5}}{\text{Target population 6 to 11 years}} \times 100$
GER Middle	=	$\frac{\text{Enrolment Class 6 to 8}}{\text{Target population 11 to 14 years}} \times 100$
GER Elementary	=	$\frac{\text{Enrolment Class 1 to 8}}{\text{Target population 6 to 14 years}} \times 100$

Enrolment includes unde raged and over age children, so GER may be more than 100

Gross Access Ratio (GAR)

GAR Primary =	=	$\frac{\text{No of Habitations having Primary Schooling facility within 1 k.m.}}{\text{Total No of Habitations}} \times 100$
---------------	---	------------------------------------------------------------------------------------------------------------------------------

The Challenge in Health: To Build from Below

1. BACKGROUND

Within the human development sector, delivery of effective public health services is the most daunting challenge facing Madhya Pradesh. Several national level evaluations have shown that Madhya Pradesh along with Orissa are amongst the two States that have the lowest indicators. However, a positive signal that has emerged from Census 2001 is that, for the first time, the growth in population has shown a declining trend. Given the fact that health indicators have not dramatically improved, this decline could be attributed to cumulative outcome of multiple initiatives that have happened in the state in the area of women empowerment, female literacy, girls education and political decentralisation which provided brought women into public space.

The management of health care if imaginatively restructured, can benefit from the multiple energies that get released in this process of decentralisation. Health sector can use this opportunity to move back to a desirable framework of comprehensive health care from the trap of selective health care in to which it has fallen. Political decentralisation provides the multi-sectoral institutional framework into which such an agenda can be seeded. The need to shift to comprehensive health care, strengthen community health action and work through institutional arrangement created by political decentralisation has informed the new health policy of the Government of India and has been a recurring theme at the People's Health Assembly held in 2001 in Dhaka. The recent initiatives of the government of Madhya Pradesh of constituting a Mission for Community Health for decentralisation of health care, the creation of a multi-sectoral forum at the district level of the District Health Society and at the state level of a State Health Society are steps in this directions.

In the last decade, while the state of Madhya Pradesh has made considerable gains and moved both in its institutional set up and in its programmatic framework in many fields, the problems of health are a challenge for everyone. Since its formation in 1956, there has been sustained state action to improve the health of the people of Madhya Pradesh, through an ever-increasing provision of health services. This has

resulted in health indicators improving over the years.

Among the many reasons for persistent poor state of health in the state is that health care delivery infrastructure in the state is still not adequate enough to meet out the health needs of the people in an efficient and cost effective manner. Given the geographical vastness of the state and its very sharp social cultural and economic diversity, it is abundantly clear that substantial inputs are still needed for the development of healthy human resources in the state. The population density of Madhya Pradesh is low, 183 persons per square kilometres, as against 324 persons per square kilometres for India¹. Thus health centres, planned and established on population norms are not spatially as accessible and plenty as required². Madhya Pradesh has a large forest cover that excludes large areas from access, and build up of social and economic infrastructure. Around 18000 of the 51806 villages of Madhya Pradesh are either forest villages or are on the periphery of a forest, and are directly affected by forests and rules and regulations governing them. With a large population of tribal communities residing in such villages, provision of health services and their access is difficult for communities residing in these villages.

This chapter is divided into three sections. The first sections deals with the state of health in Madhya Pradesh. Covering different indicators of health, and related issues such as nutrition, sanitation, drinking water etc., this section puts forward the picture of health. Attempt is also made to highlight, gender, social and regional differences within the state. The next section talks of the institutional response to health, the government health services, the role of the private sector, and tries to highlight major policy and programmes in health, with comments on their efficiency and impact. The third section deals with the challenge of health.

2. STATE OF HEALTH

The state of Madhya Pradesh has recently (2000) been divided into Madhya Pradesh and the newly carved state of Chhattisgarh. Information and data available for most health parameters till recently was for the undivided state of Madhya Pradesh. While time series data pertaining to the new state of

1. Provisional Population Totals, Census of India 2001, Registrar General of India, New Delhi.

2. India's population density is 324 persons per square kilometre while that of Madhya Pradesh is 196 persons per square kilometre in 2001 (Census of India 2001).

Madhya Pradesh is not available, some data is now available for latest years on crucial health indicators, or is just becoming available, and shall be used as and where possible.

2.1 Life Expectancy and Death Rates

Life expectancy at birth (e^0)³ is the most comprehensive indicator of health. A better health status can be safely assumed to give a better life expectancy to people. The latest estimate for Life Expectancy at Birth in Madhya Pradesh was 55.2 years for the period 1992-96⁴. While this is a considerable jump from 47.2 years for the period 1970-75 and 49.0 years for 1976-80, it is far behind the national life expectancy of 60.7 years at birth. Within the state there are geographical differences in life expectancy, with rural life expectancy of 53.7 years substantially less than urban life expectancy of 63 years.

Male life expectancy in 1992-96 is little higher than that of females (55.1 years to 54.7 years). The female have biological superiority in terms of better survival and therefore to compare male and female life expectancies, we assume that female life expectancy should be about five years more than males. Therefore the near equal life expectancy of males and females in effect show that females in comparison to men do not enjoy an equal health status.

The death rate of Madhya Pradesh in 2000 was 10.2⁵ per 1000 population, and this is 20 percent higher than the Death rate for all India. Over the last two decades there has been a sharp decline in the death rate from 15.2 in 1980 for the undivided state to 10.2 for the new state today. The death rate in rural Madhya Pradesh was assessed at 11.0, while urban death rate was 7.5.

Table 1: Estimates of Life Expectancy at Birth in Madhya Pradesh

Year	Total							
	Total				Male		Female

3. Life Expectancy is the number of years a newborn is expected to live at the time of his or her birth. Life expectancy is different for different ages, and also changes over time, with medical and health systems improving and so on.

4. The best estimates for life expectancy are provided by the Sample Registration Scheme (SRS) of the Registrar General of India, and reference to any data from this scheme will be referred to as SRS.

5. This data pertains to the new state of Madhya Pradesh, SRS October 2001.

Graph 1: IMR in Madhya Pradesh and India: 1980 to 1999

2.2 Infant and child mortality

State of Infant and child mortality would perhaps be the best assessment of the state of basic health care, quality and reach of health delivery, general environment for health, crucial health determinants such as nutrition, sanitation, safe drinking water etc. It would also be a very good determinant of the performance of development initiatives that focus on poverty, backwardness, gender equity, and even empowerment. Infants (up to the age of one year) and children (up to the age of five) die prematurely of causes such as low birth weight, pneumonia, and certain vaccine preventable diseases such as measles, every one of which is preventable through primary health care interventions. While the state, and agencies involved with health have made provisions and extensive programmes and systems to enable immunisation of all children, provide them with vitamin A supplements, encourage paediatric care, the number of infants and children dying prematurely is very high.

The Infant Mortality Rate for the new Madhya Pradesh has been estimated by SRS⁶ at 88 in 2000. The rural IMR is 94, while urban IMR 54. The national IMR at the same time was 68. Madhya Pradesh falls amongst the lowest in IMR compared with other states. The trends of IMR for the undivided Madhya Pradesh and India are depicted in Graph 1.

In terms of gender differences in IMR, SRS has recently also provided information for new Madhya Pradesh, but for the year 1999. Although the girl child is a stronger baby than her brothers, and should naturally have a lower mortality, this is not the case. The male and female IMRs were estimated at 89.6 and 89.5 for entire state, and 94.9 and 96.8 for rural areas. It is only in urban areas that the female IMR of 50.7 is lower

than the male IMR of 59.6. The gap between female and male infant mortality has reduced as compared to the last decade which is an important step towards the direction of equity of status.

In the first year after birth, mortality of infants is categorised into three periods, and these are based on the quality and magnitude of risk faced by an infant in its various stages of growth. These are termed as early neo-natal⁷, neo-natal⁸ and post natal. Post natal and neo-natal mortality rates are presented in Table 2. The data shows that since 1980 post-natal mortality rate in Madhya Pradesh declined from 56.9 to 30.4 (decline by nearly half), accounting for 40 percent of infant deaths in 1980 to 32 percent of infant deaths in 1999. The decline in peri-natal mortality was much lesser, from 64 in 1980 to 56 to 1999, a reduction by just 12.5 percent. National Family Health Survey 2⁹ (conducted in 1998-99) reported an infant mortality rate of 86 for the new Madhya Pradesh, and neo-natal mortality of 54.9, accounting for almost two thirds of all infant deaths.

There is encouraging decline in post-natal mortality, however the situation in case of neo-natal mortality remains a worry. Any reduction in mortality in this period would have a significant impact on survival of children. The main causes of early neo-natal and neo-natal mortality are tetanus, complications in birth, birth related injuries, sepsis, etc. These can be directly controlled by early tetanus immunisation of mothers during pregnancy and child after birth, and proper attendance during delivery, preferably institutional deliveries.

**Table 2: Comparison of Child Mortality¹⁰
Figures from National Family Health
Surveys and Sample Registration Scheme
(undivided Madhya Pradesh)**

Survey and Year	Neonatal Mortality	Post neonatal Mortality	Infant Mortality	Child Mortality	Under 5 Mortality
NFHS 1 MP: 1988-92	53.2	32	85.2	49.3	130.3
NFHS 2 MP: 1994-98	54.9	31.2	86.1	56.4	137.6

10. Child Mortality is the probability of dying between the first and fifth birthday.

Immunisation Schedule for Children

At birth	BCG
1_ Months	DPT – I, Polio – I
2_ Months	DPT – II, Polio – II
3_ Months	DPT – III, Polio – III
9 Months	Measles
18 Months	DPT Booster, Polio Booster
5 Years	DT

The child mortality rate of Madhya Pradesh assessed in the NFHS 2 survey was 56.4, nearly double of the national average. The age specific mortality rates provided by SRS also show a similar picture.

Factors behind Infant Deaths

An attack on high infant and child mortality in particular has been led by programmes for universal immunisation, promoting and ensuring hygienic and safe delivery practices, promoting better natal and child care etc. National Family Health Survey 2 shows that in 1998 in Madhya Pradesh only 22.4 per cent children received the entire dosage of vaccines, indicating nearly eighty per cent of children in Madhya Pradesh are potentially vulnerable to preventable diseases.

The recently conducted multi-indicator cluster surveys and coverage evaluation survey results are encouraging, and they confirm that the percentage of fully immunised children has gone up to 50%, showing a jump of nearly 25 percentage points and an improvement in access of immunisation services.

The NSS survey data shows that it is easier to ensure that infants receive their first dose in the case of multiple dose vaccines. There is a lot of dropping off of infants for each successive dose. Children, who receive the first dosage, start missing out on further doses subsequently.

Diarrhoea is a common disease afflicting children. In the control of diarrhoea, basic oral re-hydration is the best method. This form is also promoted through state wide promotion of ORT, which aims to increase awareness amongst women and within the community on dehydration from diarrhoea, how to treat it and simultaneously ensure widespread availability of Oral re-hydration salts. NFHS 2 gives an idea of the impact of this and other associated programmes. In 1998/99, while 23 per cent children aged up to 3 years had suffered from diarrhoea within a fortnight of the survey, 30 per cent of these children were given oral re-hydration salts, whereas 46 per cent received some form of oral re-hydration therapy.

Post birth, infants and children need regular paediatric care. NSS 52nd Round found that 57 per cent children in Madhya Pradesh were registered for paediatric care. Of the

Table 3: Estimates of NFHS 2 and NSS 52nd Round on Children Receiving Vaccination, 1995-96

Vaccination	NSS 52nd Round		NFHS 2	
	Age of Child	Children who never received vaccination (NSS) – 1995/96	Vaccination for ages 12-13 months	Children who did not receive vaccination (NFHS2) – 1998
Measles	0-4	43.4	Measles	64.5
OPV	0	47.3	Polio 1	37.1
	1	21.8	Polio 2	43.0
	2	19.9	Polio 3	53.1
	3-4	23.1		
BCG	0	35.3	12-23 months	35.1

	2	22.9	DPT 3	56.3
	3-4	29.0		

Source : NFHS2 and NSS 52nd round

children going for paediatric care, 67.5 per cent did so with a hospital, 16 per cent with a doctor, and another 16 per cent with an ANM or local health worker. The reach of paediatric care clearly needs to be doubled covering every single child.

2.3 Age Specific Death Rates

If we analyse information on age specific death rates with estimated population in these age groups, it tells us about the age groups where more deaths are taking place (see Graph 2) The maximum deaths occur in the age group of 0-4, a share of 37 per cent of all deaths. If for a moment we accept that all deaths in the age group 50 and below are the main concern for the health system, then the child deaths (0-4 years) make up for 62 per cent of such mortality. Any attempt to improve health will therefore have to re-emphasise and focus to address pre-mature mortality between the ages of 0-4 years with priority.

A comparison of the age specific death rates for India and Madhya Pradesh in Graph 3 shows that the substantial difference in death rates between India and Madhya Pradesh is up to the ages 0-24 years. The difference in death rates remains more moderate after that. The high differential in early years clearly points out to the main areas of weakness in the health of the state.

Graph 2: Deaths by Age Group in MP, 1996

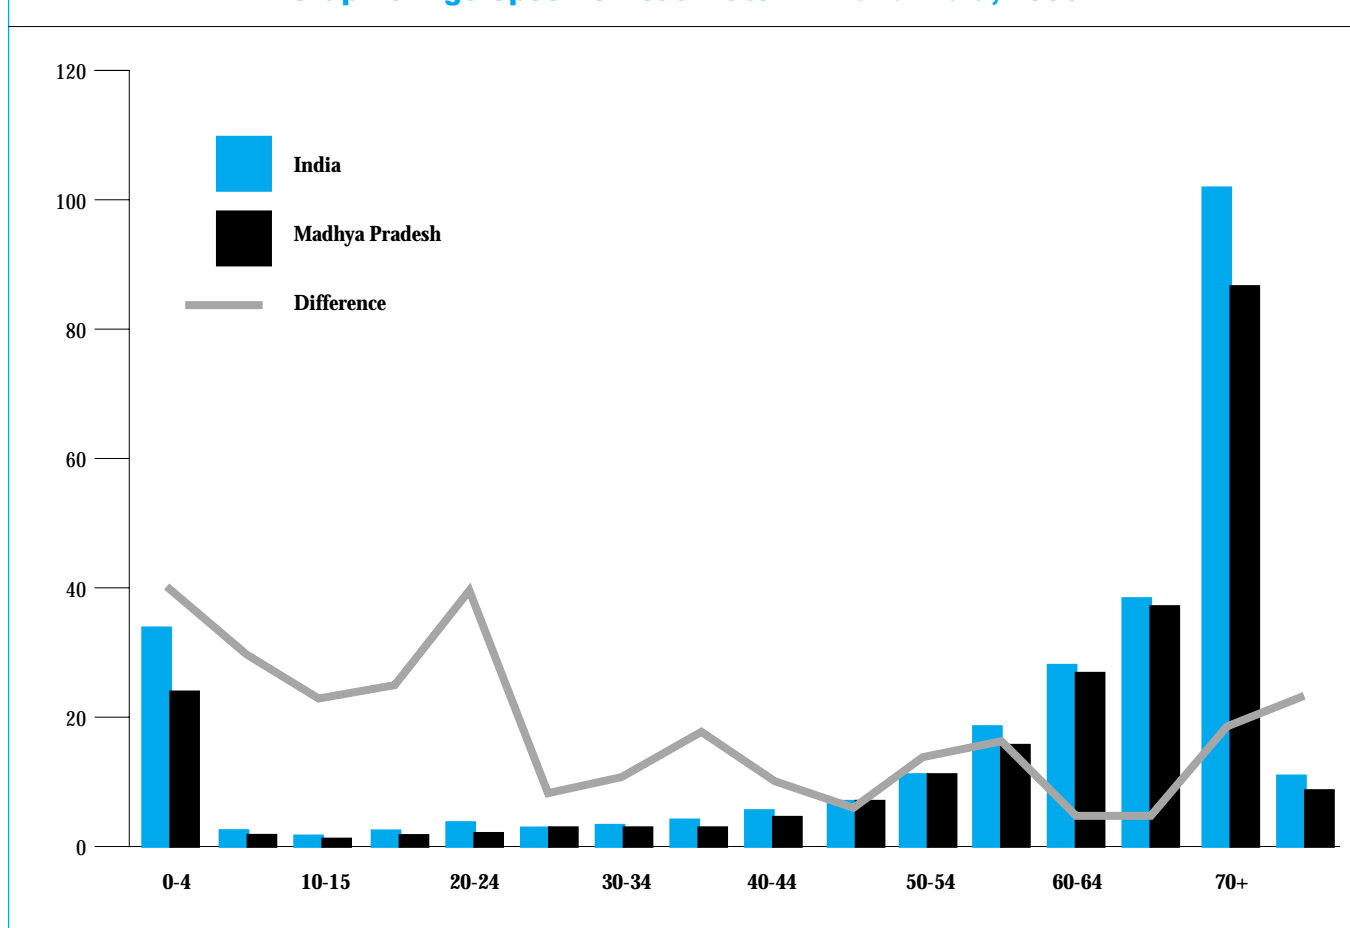

What are the causes of such high mortality in these early years? There is lot of evidence to show the causes – we have seen evidence of poor immunisation above, and we will see later in this chapter that poor nutrition, poor medical and general care during childhood, neglect of girl child and poor infrastructure in terms of road network are significant contributory factors.

2.4 Fertility, Birth Rates and Maternal Health

The fertility rate in Madhya Pradesh for 1997 was 4.0¹¹, much higher than national Total Fertility Rate (TFR) of 3.3, and far from the targeted net replacement rate of TFR of 2.1. At the current rate of decline of TFR, it will take at least another thirty years for Madhya Pradesh to achieve a net replacement rate of 2.1 (the case is similar for rural Madhya Pradesh). The Total Fertility Rates for rural Madhya Pradesh was 4.4, and 2.6 for urban areas.

In Madhya Pradesh the maternal mortality rate was 498

Graph 3: Age Specific Death rate - MP and India, 1996

11. SRS Estimates for 1997

deaths per 1,00,000 live births (all India was 408) according to SRS in 1998. Let us take a look at the situation of health services for women and pregnant mothers.

The 52nd survey of NSS in 1995/96¹² found that 41.7 percent pregnant women were actually registered for pre-natal care in Madhya Pradesh. The most important source for pre-natal care of pregnant women was public hospitals (43 percent) and Primary Health Centres (PHC) (42.6 percent) in rural areas and public hospitals (56.3 percent) in urban areas. In terms of pre-natal medical services, only 27 percent pregnant women had received both the required dose of tetanus toxoid and 40 percent had received IFA tablets. Only 16.4 of all deliveries were in a health institution in Madhya Pradesh. Further, 36 percent deliveries did not have any attendance during delivery (39 percent in rural Madhya Pradesh). At the current birth rate, we can expect that over six and a half lakh children born in a year are delivered without “proper” attendance. This large number of unattended deliveries would explain to a large extent the one and a half lakh plus infant deaths that take place in Madhya Pradesh in current years.

The NSS findings are supported by the NFHS 2 survey in 1998, in which 55 percent mothers received two or more doses of tetanus toxoid, and almost half the mothers received iron and folic acid tablets or syrup. About 11 percent mothers received antenatal check up through home visit, and another 51 percent mothers received antenatal check up outside home.

It is evident that the number of women seeking pre-natal basic care is low, number of women protected from tetanus and anaemia is low, and a large number are exposed to risks of child birth. Another contributing factor to women’s health is low age at effective marriage. NFHS 2 found that age at effective marriage in rural Madhya Pradesh is was 15.5 years with average age of first born 18.1 years. Low age at effective marriage puts girls at risk of motherhood in early ages.

2.5 The Disease Burden

Exact rates of morbidity or affliction of diseases are difficult to estimate. There is information on morbidity rates for diseases handled through vertical programmes of Government of India through their MIS systems. Some of these diseases are malaria, tuberculosis, leprosy, and blindness.

Some indirect measures are available from the NHFS survey and NSS 52nd Round. NSS gives three estimates from its survey. It found that nearly one out of every twenty five persons in rural Madhya Pradesh was ill the period of fifteen days preceding the survey. Applying this percentage to population size, we find that the number of ill at any point of time would be approximately eighteen lakhs in rural Madhya

Table 4: Rural Persons Reporting Illness, NSS 52nd Round

Percentage persons reporting any ailment during the last 15 days by sex for all types of ailments

	Male	Female	Person
India	5.4	5.7	5.5

Prevalence of acute respiratory infection, fever and diarrhoea

	Percentage of children under age 3 years suffering in past two weeks from:				
	Cough accompanied by fast breathing (ARI)	Fever	Diarrhoea		Percentage with ARI taken to health facility or provider
			Any diarrhoea	Diarrhoea with blood	
MP	29.2	31.0	23.4	4.3	57.9
India	19.3	29.5	19.2	2.6	64.0

Source: NFHS- 2

Pradesh. The data from NSS however does show that the persons reporting ailments are amongst the lowest compared to the other major states in India.

The morbidity level of children from acute respiratory infection, diarrhoea and fever is in the second section of Table 5. While nearly quarter children suffer from diarrhoea at any point of time, thirty percent have symptoms of acute respiratory infection. The NHFS survey found that about half of the children with ARI did not receive health care from any health facility or health provider, and ARI and related infections are the common killers of infants and children.

12. Sarvekshana, 82nd Issue, NSSO, Government of India, page 31

3. DETERMINANTS OF HEALTH

Health is determined by many factors that are personal, economic and social. It is convincingly argued that the most crucial determinant of health is poverty. We shall not dwell into poverty directly here, but discuss more direct determinants of health, which are also associated with poverty — nutrition, sanitation, drinking water etc.

3.1 Nutrition

The nutritional status of any population is a complex and composite entity, being a reflection of overall socio-economic status and stratification, livelihood and food security, intra-household food distribution patterns, food related practices and dietary habits. In addition, the effectiveness of various nutritional supplementation programmes, including those for micronutrient supplementation, affects the nutritional status of a community.

3.1.1 Household food expenditure

The disposable income available to a household, and the related expenditure is one of the most important determinants of the quantity and quality of the household's food intake. In this context, the Mean Per capita Expenditure per month for rural India is Rs. 287.1. The situation of Madhya Pradesh in comparison to other selected states is shown in Table 6.

What emerges from an All-India comparison is that Madhya Pradesh has the lowest per capita expenditure on food amongst all the Indian states. This is primarily a manifestation of widespread poverty and lack of livelihood security, and is arguably the most important factor, responsible for determining the poor nutritional status of people in the state.

Table 6: Estimated Per Capita Expenditure (Rs) per month for Selected States

State	Food expenditure	Non-food expenditure	Total
Madhya Pradesh	128.6	79.4	208.0
Orissa	145.2	65.4	210.6
Bihar	151.6	66.5	218.1
Uttar Pradesh	192.5	113.4	305.9
Rajasthan	243.5	166.8	410.3
Gujarat	191.5	99.6	291.1
Punjab	320.3	234.2	554.5
All India	183.3	103.8	287.1

Source: NCAER, India: Human Development Report, 1999

3.1.2 Availability of Food

Per capita consumption of food grains is one key indicator linked to food security. In this context, Madhya Pradesh has a

Table 7: Per Capita Food Grain Consumption and Utilisation of PDS for Selected States

State	Per capita food grain consumption per month (kg)	Quantity of cereals (kg) bought from PDS per hh / month	Percentage requirement of cereals met by PDS
Madhya Pradesh	13.5	15.7	20.4
Orissa	16.4	18.6	16.7
Bihar	14.8	49.5	29.2
Uttar Pradesh	15.2	33.4	24.5
Rajasthan	17.6	33.1	14.7
Gujarat	10.1	17.3	18.1
Punjab	14.3	23.4	5.5
All India	14.3	19.0	23.5

Source: NCAER, India: Human Development Report, 1999

lower per capita food grain consumption level (13.5 kg. per month). The combination in Madhya Pradesh of low annual per capita income (Rs. 4166) and low food grain consumption is not positive at all for a good healthy population, and it is unlikely that the basic caloric requirements are met by other, non-food grain sources. This tends to indicate an overall deficit of food intake. On the other hand, certain states with a comparatively higher annual per capita income, such as Kerala (PCI - Rs. 5778), Gujarat (PCI - Rs. 5288) and North-eastern states (PCI - Rs. 5070) also have somewhat low food grain consumption but this is mainly because of dietary practices which favour non-grain food intake.

3.1.3 Food intake among vulnerable groups

Given this background of household food expenditure, we may briefly examine the situation of food intake by various vulnerable groups, particularly women and the tribal population, especially tribal children.

Table 8: Women's Frequency of Consumption of Specific Foods in Madhya Pradesh

Type of food	Daily	Weekly
Milk or curd	20.3	12.1
Pulses or beans	43.0	36.9
Green, leafy vegetable	40.9	40.1
Other vegetables	53.0	33.1
Fruits	5.0	17.6
Eggs	0.9	10.8
Chicken, meat or fish	0.5	10.7

Source: NFHS -2, Madhya Pradesh (National Family Health Survey, 1998-99)

Regarding nutrient food items, somewhat less than half of women consume pulses or green leafy vegetables daily. Since these are the major sources of protein and several vitamins and minerals in the usual Indian diet, a less frequent intake (weekly or less), which is the pattern for the majority of women, is not likely to be adequate. Other nutritious foods like milk/ curd, fruits and non-vegetarian foods are consumed much less frequently. Milk or curd is consumed either daily or weekly by only about one-third of women.

The tribal or *adivasi* population of the state is especially vulnerable regarding food security and food intake, for a variety of reasons. One major factor is the process of alienation from traditional natural resources, which many such communities have undergone in the previous decades, due to various reasons such as deforestation, land degradation etc. Additional stresses due to drought may then contribute to tipping the balance critically towards severe food insecurity (see Box on Drought and Nutrition in West Madhya Pradesh).

Graph 4: Adequacy of Calorie Intake in Tribal Population

Source: National Nutrition Monitoring Bureau, NIN : Diet and Nutritional Status of Tribal Population, Report on First Repeat Survey, 2000

Among all the vulnerable population groups, inadequacy of protein/ calorie intake is quite striking. Looking at the groups most at risk, namely the pre-school children and children below 10 years of age, we find that *only about one-third of these tribal children receive a diet adequate in calories and protein*. Similarly, among elder children (10-12 years) and pregnant and lactating women, only around half of the tribal population in these groups has adequate caloric and protein intake.

It may be noted that an intake of *less than 70% of the recommended daily allowance* constitutes a serious dietary deficiency. However, about one-fourth of tribal children do not receive even this bare minimum cereal intake, exposing them to the risk of severe malnutrition (see Table 9).

Table 9: Adequacy of Intake of Major Food Categories – Tribal Children in Madhya Pradesh

	Age 1-3 years ≥ 70% RDA*	Age 4-6 years ≥ 70% RDA*
Cereals and millets	77.4	77.2
Pulses	35.0	45.8
Leafy vegetable	11.1	11.4
Other vegetable	32.4	31.4
Roots and tubers	39.7	36.8
Milk and milk prod.	0.3	0.9
Fats and oils	3.9	0.9
Sugar and jaggery	0.5	0.2

*Recommended daily allowance

Source: National Nutrition Monitoring Bureau, NIN : Diet and Nutritional Status of Tribal Population, Report on First Repeat Survey, 2000

3.1.4 Nutritional status of women

With this background, we can look at the nutritional status of women in Madhya Pradesh, and also examine variations and disparities among various sections of the population of women. Special emphasis is required relating to tribal women,

Table 10: Nutritional Status of Women in Madhya Pradesh

Background Characteristic	% of women with BMI below 18.5
1. Residence	
Urban	28.2
Rural	41.8
2. Region	
Vindhya	25.0
Central Madhya Pradesh	30.5
Malwa Plateau	36.3
South Central Madhya Pradesh	47.1
South Western Madhya Pradesh	36.9
Northern Madhya Pradesh	33.8
3. Caste/Tribe	
Scheduled Caste	39.9
Scheduled Tribe	49.2
Other Backward Class	37.4
Other	27.4
Total	38.2

BMI: Body Mass Index; a BMI less than 18.5 denotes under nourishment

Source: NFHS –2, Madhya Pradesh (National Family Health Survey, 1998-99)

because of their socio-economic situation.

Given the information about women's intake of nutritious foods discussed above, it is not surprising to note that 38.2% of women in Madhya Pradesh are undernourished and hence some grade of Chronic Energy Deficiency. However, the disparities among various social strata are responsible for even higher levels of under nutrition. Rural women are one-and-half times more likely to be undernourished than urban women. There are significant regional disparities too, with women from the 'South Central' area faring much worse than those from Vindhya and Central Madhya Pradesh. And finally, prevalence of under nutrition among tribal women is almost twice of those in the 'other' category.

3.1.5 Nutritional status of children

Anthropometric indices such as Weight for age (indicating proportion of underweight children) and Height for age (indicating proportion of stunted children) are commonly used to assess the nutritional status of children in a population. According to both Weight for age and Height for age, about half of the children in Madhya Pradesh are malnourished and one-fourth are severely malnourished. Again, there are significant social disparities among social strata. Proportion of underweight (58.4%) and stunted (54.3%) children in rural areas is much higher than that in urban areas, and similarly tribal children are worse off compared to those from 'other' group. However, there do not appear to be major regional disparities in this regard.

Table 11: Nutritional Status of Children in Madhya Pradesh

Background Characteristic	Weight for age		Height for age	
	Percentage of children		Percentage of children	
	Below -3SD	Below -2SD	Below -3SD	Below -2SD
1. Residence				
Urban	19.5	44.3	19.6	39.8
Rural	25.7	58.4	30.9	54.3
2. Caste/Tribe				
Scheduled Caste	30.0	57.5	32.2	52.7
Scheduled Tribe	31.4	64.5	33.6	59.9
Other Backward Class	22.4	55.4	28.1	51.5
Other	14.5	40.5	18.5	37.2
Total	24.3	55.1	28.3	51.0

Source: NFHS -2, Madhya Pradesh (National Family Health Survey, 1998-99)

A further look at the nutritional status of tribal children in Madhya Pradesh confirms what we would expect from the data on food intake already discussed above.

Table 12: Nutritional Status of Children in Tribal Areas in Madhya Pradesh

Sex	Below -3SD		Between -3SD and -2SD		Total below -2SD	
	Wt.for age	Ht.for age	Wt.for age	Ht.for age	Underwt.	Stunting
Boys	42.5	53.0	31.6	21.7	74.1	74.7
Girls	41.3	54.1	32.9	18.2	74.2	72.3
Both	41.9	53.6	32.2	19.9	74.1	73.5

Source: National Nutrition Monitoring Bureau, NIN: Diet and Nutritional Status of Tribal Population, Report on First Repeat Survey, 2000

The NNMB survey shows that almost three-fourths of tribal children in Madhya Pradesh are underweight (74.1%) and stunted (73.4%). (This is somewhat higher than the NFHS proportions, perhaps because of sampling variation). What is more worrisome is the very high proportion of *severely underweight tribal children, at about 42%*, this being a group which is most vulnerable in situations of fluctuation of food supply or infectious illnesses.

In response to the problem of under nourishment, there has been sustained effort to reduce malnourishment. Simultaneously, the government set up a system of regular survey of children to assess the levels of nourishment amongst them. The data from these surveys over the period of last one year shows that there is reduction in malnourishment. In October, 2001, this survey of 61 lakh children found that while 52 percent children were moderately malnourished, and 5.3 percent severely malnourished. The survey in September, 2002, surveyed 59 lakh children and found that while moderately malnourished children were 53 percent, percentage of severely malnourished had dropped to 3 percent.

3.1.6 Anaemia among women and children

Iron deficiency anaemia is probably the most prevalent and significant micronutrient deficiency to be seen in our country, with major consequences for well-being and work efficiency. The prevalence of anaemia among women is an index, which reflects the combined impact of availability of nutrient foods to the household, gender-equity of food distribution within the household, and effectiveness of iron-folic acid supplementation through the health services. A high prevalence of anaemia in a population usually reflects an unfavourable situation regarding all these factors.

Data from the NFHS 2 survey shows that over half of the women in the state (54.3%) have anaemia, with one-sixth (16.7%) having moderate or severe anaemia, a little higher than the proportion of anaemia among women nationally (51.8%). Rural women are one-and-half times more likely than urban women to have moderate/ severe anaemia. There are some regional differences, with women in Malwa (38.2% anaemic) faring significantly better than their sisters

Drought and Nutrition in Western Madhya Pradesh

The nutritional status of any population is closely related to the food supply and food security of communities within that population. Given the context of varying degrees of drought in parts of West Madhya Pradesh during the years 1998 to 2000, it is especially relevant to understand the state of nutrition in this region and its relationship to health in the recent period.

The South-west monsoon 2000 brought 31% less rainfall than the average and Western Madhya Pradesh received only 65% of its normal rainfall. 22,490 villages in 32 districts of Madhya Pradesh were officially declared 'drought affected'. The number of drought affected people in the year 2000 comprised 26.17% of the states population.

In this setting, surveys in the drought-hit district of Barwani in West Madhya Pradesh conducted by CEHAT (Centre for Enquiry into Health and Allied Themes) in collaboration with local organisations give some idea of the impact that drought has had on nutrition in the region—

- A sample of 712 under-five children from two blocks were studied for their nutritional status based on 'weight-for-age'. Of these, 84% children were found to have some degree of mal nourishment, and 21.9% children had severe mal nourishment. These figures correlate with the findings of the special study report on nutritional status of tribal children by NNMB, who found 20.4% of the sample of tribal children in Madhya Pradesh to be severely malnourished
- A similar study of 132 adults showed 63% individuals to have a BMI

of below 18.5, i.e. some grade of under nutrition. However 15% adults had a BMI of less than 16, indicating severe under nutrition (Chronic energy deficiency Gr. III) in this group. These proportions are somewhat higher for the figures related to tribal areas of Madhya Pradesh. According to the NNMB data collected from the tribal areas of Madhya Pradesh, 49% of the adults are undernourished (BMI < 18.5) and 8% are severely undernourished (BMI < 16).

- The impact of drought was observed clearly in these villages in the form of reduced dietary intakes, with reduction in non-cereal food items like pulses, vegetables, cooking oil etc. Some families also had significant reduction in the quantity of intake of cereals. A few families reported occasional consumption of famine foods like forest leaves and tubers during the height of the food scarcity due to drought.

One impact of the study process has been the subsequent dialogue between the 'Jan Swasthya Samiti', a local voluntary group, and the ICDS authorities. This is accompanied by a process of people's monitoring of ICDS services, to ensure better utilisation of Aanganwadi services by the tribal communities, which could have an impact in reducing malnutrition.

Sources- National Disaster Management Committee weekly drought report No. 10; copy of Madhya Pradesh memorandum of scarcity; Diet and Nutritional status of tribal population – report on first repeat survey by National Nutrition Monitoring Bureau, 2000; Article on pp. 38-39, SROTE science and technology features, Oct. 2001.

in South-Central Madhya Pradesh (59.5 % anaemic). Tribal women seem to be suffering the most, with almost three-fourths (70.3%) being anaemic and almost one-fourths (23.8%) having moderate or severe anaemia.

We see that *three-fourths of children in Madhya Pradesh are anaemic*, and strikingly, *over half of the children have moderate/ severe anaemia*. This high prevalence of anaemia cuts across all regions, though children from Northern Madhya Pradesh fare the worst with 85% being anaemic and almost two-thirds having moderate/ severe anaemia. Similarly, *among tribal children, almost two-thirds have moderate/severe anaemia*. However, there are hardly any significant urban-rural or gender differences in this regard.

3.2 Food Supplements

While household food intake is the main determinant of nutritional status, nutritional supplementation has an important role to play in ensuring minimum nutrient intake to vulnerable groups. Below we examine a few key supplementation measures, which have a direct bearing on the nutritional status of women and children.

Supplementation with Iron-Folic acid during pregnancy is the most widely practiced and institutionalised form of micro-nutrient supplementation, as part of the National Nutritional Anaemia Control Programme. This is one of the

basic components of routine ante-natal care and has a significant role to play in prevention or correction of anaemia among women. However, it is important that Iron-FA is given and consumed for an adequate period, usually considered to be at least three months. Survey carried out by the NFHS 2 shows that in Madhya Pradesh, *about half (48.9%) women received Iron-FA during pregnancy, but only 38.8% received it for an adequate period*. Women in urban areas are one-and-half times more likely to receive Iron-FA during pregnancy than those from rural areas. *Only about one-third of tribal women received Iron-FA, and about one-fourth received it for adequate duration*.

A similar major supplementation programme relates to Vit. A, which has important consequences for visual health and resistance to infections among children. Supplementation with Vitamin A to pre-school children is the major programmatic form of micro-nutrient supplementation for children, in the form of the Vitamin A Prophylaxis Programme. A massive dose of Vit. A is to be given once in every six months to children between the age of 6 months and five years. In this context, we observe from data revealed by NFSH2 that only one in seven children in Madhya Pradesh received a dose of Vit. A during the last six months. The same report further also shows that in areas like Vindhya and Northern MP, this proportion was extremely low, less than 10% of children having received it.

3.3 Sanitation

3.3.1 Water and solid waste management

The infrastructure or facilities for ensuring proper waste water disposal in Madhya Pradesh are currently inadequate. The NSS 52nd survey undertaken in 1995/96 found that a third of the rural and a quarter of urban households had no waste water drainage system. To further compound this, 29 percent rural households had some sort of an “open kuccha” drainage system, whose efficiency in dealing with dirty water, ensure its swift flow, and prevent spillage and water logging is doubtful. Even in urban households, “open kuccha” drains serve 21 percent. The type of latrine is also directly connected to level of sanitation. In rural Madhya Pradesh in 1999, NSS 54th round¹³ estimated that 94.5 percent used no latrine, and the state comes last amongst fifteen major states in India in use of latrine by rural households. Even in urban Madhya Pradesh in 1999, 45 percent households used no latrine.

The lack of adequate drainage adds onto problems like stagnant water, poor waste disposal, and with lack of toilet facilities, the chances of water and air contamination increase. In urban Madhya Pradesh, nearly fifteen percent people live in slums, and they would be specially subjected to dirty sanitary conditions, dirty stagnant water, poor drainage, lack of proper waste disposal, and unhygienic housing.

3.3.2 Household air pollution

NSS 49th round survey in 1993¹⁴ showed that of the rural households in Madhya Pradesh in 1993, nearly 95 percent used leaves or straw or firewood for cooking, thereby exposing women to dangers from smoke from these sources of energy. Even in urban Madhya Pradesh, nearly 45 percent households used similar cooking fuel. Use of polluting fuels at home and general unsatisfactory hygiene in home would be one of the major contributing factors to the

high prevalence of respiratory diseases found in the state.

3.3.3 Vectors

A significant piece of information from NSS 54th round survey was on number of households reporting an increase or decrease in the problem of flies, mosquitoes and foul odour over the last five years. These measures are a direct indicator of the menace of in-sanitary conditions and a cause of many of the disease infecting people of the state. The reports from rural households are somewhat better than what the urban residents find as far as increase in flies, mosquitoes and foul odour is concerned. A high 58 percent rural and 77 percent urban households reported that mosquitoes have increased over a period of five years. This widespread feeling that there has been an increase in flies coupled with lack of proper drainage and waste disposal does not augur well for a healthy environment.

If we convert the percentages to population, we see in Table 13 that while around 36 lakh people have benefited from a cleaner environment that has lesser flies and sixteen lakhs find fewer mosquitoes, 2.68 crores live with more flies and 3.8 crores suffer more mosquitoes in the state.

3.3.4 Drinking water

With water borne disease reported to account for a very large share of diseases suffered by people, adequate and safe drinking water is crucial for a healthy population. Let us first get an idea of the status of drinking water in Madhya Pradesh.

We get an idea of the adequacy of drinking water by households from NSS 54th round¹⁵ conducted in 1998. About 13 percent rural households and 16 percent urban households in Madhya Pradesh appear to have insufficient drinking water. Reading it the other way, the number of people now with access to safe drinking water is very high in Madhya Pradesh. The progress over the last years in further public provisioning

Table 13: Households Reporting Increase or Decrease in Problem of Flies, Mosquitoes and Foul Odour over Last Five Years, 1999

Area	Flies		Mosquitoes		Foul Odour	
	Increase	Decrease	Increase	Decrease	Increase	Decrease
Rural Areas	43.8%	7.3%	57.9%	3.5%	22.1%	8.3%
Urban Areas	46.2%	2.2%	76.5%	0.4%	40.8%	2.3%
Population	2,68,35,144	35,86,882	3,79,58,065	16,14,299	1,63,56,295	40,45,809
Percentage	44.4%	5.9%	62.9%	2.7%	27.1%	6.7%

13. Sarvekshana, 82nd issue, January-March, 2000, NSSO, Government of India

14. Sarvekshana, 78th issue, January-March, 1999, NSSO, Government of India

15. Sarvekshana, 82nd issue, January-March 2000, NSSO, Government of India

of safe drinking water in the villages has been very encouraging. Over the last eighteen months, from just a little less than ten thousand habitations (out of 1.11 lakh overall habitations) without full access to safe drinking water, only twenty six hundred habitations remain without proper access to drinking water.

However, there is very little really known on the quality of drinking water. But we can use other measures to get an indirect idea of the possible quality of drinking water.

The source of drinking water would determine to a large extent, what is the surety of safe drinking water for households. The data from NSS 54th round¹⁶ in 1998 tells that rural households use tube well or hand pump (52 percent) and wells (39 percent) maximum. In the case of both, maintenance and cleanliness of the source determines water quality. The same survey further finds that only 29 percent rural households used some form of cleaning the water before drinking, by filtering with plain cloth (24 percent), some other form of filtering (3 percent), and 1.3 percent chemically treated the water before drinking it. In urban areas, 36.5 percent households filtered drinking water before drinking. In both the cases there is very little precaution taken by households to treat the water in some manner before consumption. With fairly poor drainage systems, wells and hand pump providing most of the drinking water, and no use of latrines, water quality cannot be assumed to be satisfactory directly from its source.

4. THE INSTITUTIONAL RESPONSE

In the first part of this chapter we have travelled some distance reviewing the state of health of the people of Madhya Pradesh. Let us now move towards the response - the thinking behind health service system, and the health services themselves.

The Bhore Committee Report (Health Survey and Development Committee Report, 1946) laid down the blueprint of the rural and urban health system in the entire nation. The basic focus of this report was to set up a primary health care system across the country to ensure availability of "basic health care" for every individual, in the context of a predominant rural population. The recommendations of the report make for a comprehensive package of preventive, promotive and curative health care and a strategy of involving people in the health system itself. This report was adopted by the Government of independent India and formed the basis of setting up an extensive health care delivery system across the entire nation, including for Madhya Pradesh.

A landmark in development of health policies and accompanying focus world-wide was the International Conference on Primary Health Care (PHC) held in Alma Ata in 1978. This conference evolved the Alma-Ata declaration which called for extending health to all people and also provided a new definition to the word 'health' itself. It affirmed

that Primary Health Care was a critical option and should be the focus for all health systems. India was a signatory to this conference and its goals. The "Health for All by 2000" thrust has guided much of our health interventions ever since. It also formed the core thrusts of the National Health Policy of 1983. The Madhya Pradesh Government health programmes have been influenced by both of these.

However this reaffirmation of Primary Health Care was immediately challenged by many international agencies and health initiatives that spoke of "Selective Primary Health Care" (SHPC). The SHPC approach argues that primary health care is too expensive, and a more effective method is to select and prioritise a limited number of major diseases and attack them through specific programmes. The focus was on delivering medical care for selected diseases rather than encouraging participation by communities in defining their health needs, and professionalise rather than de-professionalise health. SHPC was a technology-focussed approach, where delivery of health care through health professionals was the focus, it detracted any society or community and medicine interface, and ignored aspects of community empowerment vis-à-vis medical services. This approach was soon adopted by international development aid agencies, including those of the United Nations.

Primary Health Care as the main vehicle to deliver good and effective medical care got subjugated by programmes and initiatives that were disease specific. This is the case both internationally and nationally. In India, a study by Duggal and Antia (1995) for instance, have noted that the Primary Health Centre and Sub-Centre networks are concerned more with family planning and meeting the targets of national disease control programmes than tackling comprehensive Primary Health Care.

A series of national level programmes catalysed by funding from bilateral and multilateral support institutions have evolved which promote the selective vertical disease control strategy. This approach has been justified on the basis of efficiency, with a techno-managerial approach, and very little involvement of the community, which is taken as a passive recipient of their benefit. A major corner stone of the Alma Ata declaration was equity and the community was emphasised as an agent of change. This approach has dropped both these key components.

A further change came in the 1990s, when the country went through an economic crisis resulting in new economic policies which promoted liberalisation, privatisation and globalisation. Conditionalities of international funding agencies during this time led to some downsizing of public health allocations and health expenditures with focus on harnessing other resources and involvement of private sector.

The above factors describe the mosaic in which the health care response of the state has to be contextualised. These

16. Sarvekshana, 82nd Issue, January-March 2000, NSSO, Government of India

factors of overall commitment to primary health care; selectivisation and verticalisation of national health programmes; the new economic context; and the downsizing of health investment; has led to a series of health care strategies not adequately integrated but each in their own way trying to reach health care primary or selective to those who need it in an in-equitous situation with additional problems peculiar to the state of access and cultural diversity.

4.1 State Policies and Initiatives

Government of Madhya Pradesh has been working on evolving a medium term health strategy, but it is still in its drafting form. The policy framework for health in then guided by the national level health policies, and some specific policies and new initiatives that the state has evolved, which have a direct and indirect bearing on health. We briefly discuss them below.

Having a direct bearing on health in the state are the Population policy, the Nutrition policy, and the Women's policy. The salient points of the population and nutrition policy are given in the box below.

The state has broadly followed the formulations of the National Health Policy and the National Health Programmes. The Rajiv Gandhi Mission for Community Health described later is a beginning of such a policy statement. For the time being, the health policies though unstated separately broadly focus on three major areas:

1. Improving infrastructure for primary and secondary health care;
2. Disease control and public health;
3. Reproductive and Child Health Programme

We shall cover the infrastructure issues in a separate section later in this chapter. Here we concentrate on the second and third aspects.

Population Policy Goals

- Total Fertility Rate to 3.0 by 2005 and to 2.1 by 2011.
- Maternal Mortality to 330 by 2005 and to 220 by 2011
- Infant Mortality Rate to 75 by 2005, and 62 by 2011
- Child Mortality Rate to 90 by 2005 and to 65 by 2011

Objectives of State Nutrition Policy

- To bring 15 percent decrease in moderate level malnutrition and 10 percent decrease in severe level malnutrition found in children less than five years of age.
- To bring 10 percent decrease in cases of low weight at birth.
- To eliminate the problem of blindness due to lack of Vitamin 'A'.
- To bring 20 percent decrease in problem of anaemia due to lack of iron, amongst pregnant women.

4.1.1 Disease Control and Public Health

While the primary health centres and hospitals provide basic and curative health services, there is also a vast network of programmes and agencies that work directly for specific diseases. These include the major centrally sponsored disease control programmes, popularly referred to as vertical programmes. Their sheer size, investments, control by the Government of India, have made these programmes large and central to the states health effort. They play a major role in the health system and absorb time, effort, planning and co-ordination systems of the state to a large extent. Five major programmes are:

1. Revised National Tuberculosis Control Programme (RNTCP) (covering the entire state)
2. National Leprosy Elimination Programme (The objective is to eliminate disease in state by 2003 and integrated into general health system by 2003).
3. National Programme for Control of Blindness (Aims to control blindness due to cataract which accounts for 70-80% of total blindness)
4. National Anti-Malaria Programme
5. National AIDS Control Programme (supports the Madhya Pradesh State AIDS Control Society to tackle HIV/AIDS problem in the state)

These programmes have been somewhat successful in reducing the incidence of leprosy, blindness, improved detection of tuberculosis, and are helping in creating awareness on HIV/ AIDS. Tackling many of these diseases poses a stiff challenge to public health, since they have specific problems associated with them. These include stigma (associated with tuberculosis, leprosy and HIV/AIDS), duration of treatment (treatment of tuberculosis and leprosy takes a long time, and patients often discontinue treatment), distance and access to treatment facilities for patients (TB and leprosy centres are few and far, and tribals and women have special problems of access), migration by patients, especially for tribals who migrate (patients migrate in search of work discontinuing treatment).

The growing private sector has not been an effective medium to tackle these diseases. The private practitioners hardly ever send patients to District Centres or PHCs/ CHCs and when they do, it is often found to be too late. The standard drug regimes are not necessary followed, and cases are not regularly recorded and followed up¹⁷. Counselling by the doctors to TB and HIV patients is usually poor.

4.1.2 Reproductive and Child Health Programme

The family welfare and RCH formed the second major component of health policy and consists of a large number of programmes that respond to the complexity of the situation. The main components are given in the box.

17. A Report on National Consultation on Tuberculosis, VHAI, 1994

Reproductive and Child Health Programme

- a) Meeting the needs for contraception and couple protection
- b) Behavioural change communication strategies
- c) Prevention of mis-use pre natal diagnostic techniques (PNDT Act)
- d) Social mobilisation for increasing age of marriage
- e) Establishing infertility diagnostic facilities
- f) Community based distribution of contraceptives
- g) Adolescent health education
- h) Management of reproductive track infection (RTI)
- i) Immunisation of children for six preventable diseases
- j) Reducing MMR due to high risk pregnancies
- k) Strengthening of first referral units (FRUs)
- l) Urban maternity and counselling centres
- m) Improving new born care
- n) Improving registration of marriage pregnancy birth centres.

These programmes are supported by the National RCH and Immunisation programmes, apart from the state's own contribution to them.

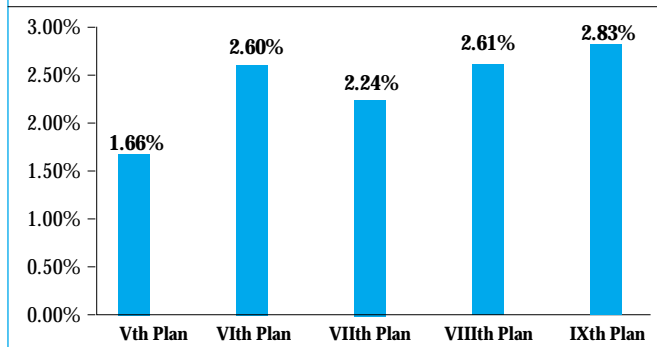

4.2 Health Care Financing and Health care expenditure

4.2.1 State Government Funds

Financial allocations in the health sector have shown a trend of decline or stagnation over the years, as per the state budget allocations. Taken at constant prices, there has actually been a decline in per capita costs.

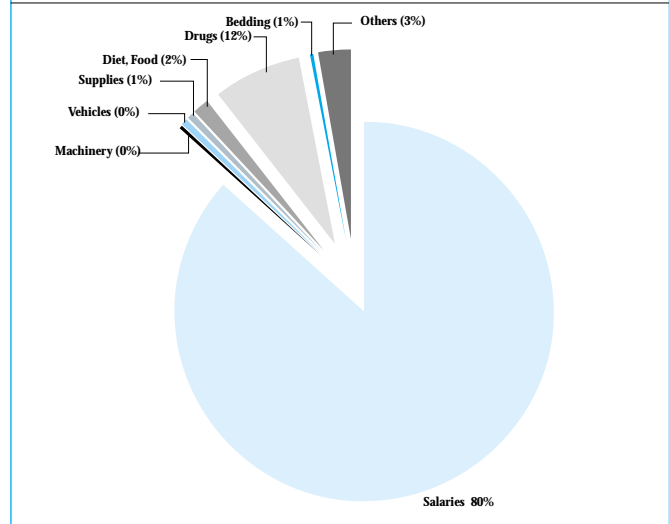

However, Government investments into the health sector have been gradually increasing in the plan allocations. The Graph 5 portrays the share of the resource allocations to the health and family welfare departments in five year plans from

Graph 5: Outlays in Health Sector in State Five Year Plans

Source: National Nutrition Monitoring Bureau, NIN : Diet and nutritional status of tribal population, report on first repeat survey, 2000

Graph 6: Non Plan Expenditure by Items, 1990-91

Graph 7: Non Plan Expenditure by Items, 1997-98

the Vth Plan. The allocations have been fluctuating but there is a gradual increase in last plans.

These allocations notwithstanding, there is a decline in per capita expenditure, and is evident from actual expenditure on the health sector in the state budgets. A study by the Asian Development Bank¹⁸ on public sector reform shows that actual per capita expenditure on health has been going down in the 1990s. Per capita expenditure of the Government

18. "Madhya Pradesh Public Finance Reform – Final Report", Tata Consultancy Services, Asian Development Bank

Graph 8: Rates of Cost Recovery in Health

Health expenditure was Rs 21.18 at 1980-81 prices in 1990-91, and has gone down over the years to Rs 16.32 per capita in 1996-97.

The expenditures comprise cost of establishment, which are primarily salaries of existing staff. The ADB study indicates that the shares of salaries in total non-plan health expenditure in the state was 87 percent in the year 1997-98. There has been a steady increase in the share of salaries over the last decade in non-plan expenditure as stated in the Graphs 6 and 7.

The increase in the expenditure on items has been 92 percent in case of salaries from 1990-91 to 1997-98, but only 4.6 percent for drugs, 0.23 percent in machinery, and 0.39 percent in supplies.

5.4.2 Externally aided health projects

4.2.2 Externally Aided Projects

Apart from own and central funds, another source of funds for the state has been through externally aided projects. These programmes have been either focussed regionally or focussed on a particular aspect of health, and have not been aiming at more definite and structural impact in the health system. In

fact this assessment of externally aided projects also forms part of the governments own current thinking (see the section on Swastha Jeevan Sewa Guarantee Yojana).

Centrally aided projects have actually resulted in moving the health sector away from comprehensive health care to selective health care. It has reinforced the vertical programmes and in fact created more of them. There is a strange situation of arguing for inter sectoral action in problem analysis and ending up with creating yet another vertical programme. This has emerged as a serious problem because it tends to make the sector forgo the benefit of horizontal linkages effected in the new dispensation of Panchayat Raj. Health sector needs extra-health sector action to be effective, and so an effective strategy would be to enlist them.

The Government of India has been equally responsible for promoting externally aided projects while paying lip service to decentralisation. Region specific problems of health redressal get low priority in such a situation.

4.2.3 User Charges

User charges have been offered as a manageable and effective means of financing the health systems. User charges are levied in government hospitals in cases of hospitalisation. The cost recovery levels have generally been abysmal. The current rates have been hovering from 1.2 to 2.5 percent over the last six years.

In recent years, the concept of Rogi Kalyan Samitis or patient welfare committees have come into play in the management of health centres across the state and have been quite helpful in generating user charges that are being utilised to modernise health centres and better patient care and facilities. More details on RKS are given later in this chapter.

4.3.3 Source of treatment and health care expenditure

One indicator of the weak and inadequate state of public health services in Madhya Pradesh is the fact that in a state with such a low per capita income, the vast majority of people are constrained to access medical care from the less affordable private sector. Some micro-studies show that non-availability of drugs, extra charging, indifferent behaviour, irregular availability of staff and other factors in the public health sector induce the poor to access private services.

Table 14: Source of Outpatient Treatment in Madhya Pradesh (in percentage)*

Rural			Urban		
Public	Private	Total	Public	Private	Total
16.74	70.52	87.26	13.67	71.6	85.27

*Some patients resorted to home treatment, medical stores etc. and hence the totals of Public and Private do not add to 100

Source: Health Care Utilisation and Expenditures in M.P., George Alex et al, FRCH, 1993

Table 15: Percentage Distribution of Ailments Treated in Inpatient and Outpatient Care Units by Source of Treatment, Madhya Pradesh 1986-87 and 1995-96

Year	Rural			Urban		
	Public	Others	Total	Public	Others	Total
(a) Outpatient Care						
1986-87	32.9	67.1	100.0	31.3	68.7	100.0
1995-96	27.1	72.9	100.0	20.4	79.6	100.0
(c) Inpatient Care						
1986-87	79.2	20.8	100.0	77.0	23.0	100.0
1995-96	53.3	46.7	100.0	56.0	44.0	100.0

Source: NSSO 1992, NSSO 1998.

According to this study in the early 90s, over 70% of outpatients in both rural and urban areas, were taking treatment from the private sector.

The time-trends in this regard as documented by NSSO show a significant and worrisome *decrease in utilisation of public health services*, for both rural and urban areas, and for both Outpatient and Inpatient care. The utilisation of 'other' sources (basically private care) has increased to above 70% in both rural and urban areas by the mid 90s. Similarly, utilisation of 'other' (basically private) sources for Inpatient care, which was only about 20% in the mid-80s has gone up to nearly half of such care by the mid-90s. This is a disturbing trend, which indicates weakening of quality or financial accessibility of public health services compared to private services. This is likely to result in both increase in costs and also greater risk of unnecessary and irrational therapy, often resorted to in order to boost private medical profits.

The per capita medical expenditure was found above Rs.125 per episode in both rural and urban areas, which may be prohibitively expensive for poor families.

The time-wise analysis based on comparing NSSO data for mid-80s and mid-90s shows overall a sharp rise in expenditure on medical care in almost all categories except public outpatient care in rural areas. The major rise in expenditure

on 'other' (basically private) services – increasing from two-fold to six-fold in a decade – is a worrying change. But of even greater concern is the *dramatic rise in out of pocket spending on public medical facilities, especially for outpatient care in urban areas and inpatient care in all areas - rising seven to nine fold* within a decade, outstripping inflation related increases. This effectively indicates a significant degree of privatisation of public health services, with patients having to pay either user charges or costs of medications and supplies, at prohibitively high levels which would effectively deny the poor access to medical care even in public hospitals.

5. INSTITUTIONAL HEALTH RESOURCES

5.1 Health Services

The state government is the single largest health provider in Madhya Pradesh, especially when it comes to preventive care and public health issues. However, the direct role of government service providers is on a decline and a majority of people resort to private health providers, especially in rural areas for medical treatment.

The National Sample Survey¹⁹ found that out of all non-hospitalised treatments, 23 percent in rural and 19 percent in urban Madhya Pradesh went to a government health facility, while 62 percent in rural and 75 percent in urban areas went to private sources. The previous NSS survey in 1986-87 had reported government sources treating 24 percent health service seekers in rural areas and 28 percent in urban areas. The use of public health services in case of hospitalised treatment is more than private sources, with the NSS 52nd Round reporting 53 percent rural and 56 percent urban patients using government health institutions in 1995/96. Overall, people are accessing private medical health services far more than public

Graph 9: Use of Government Facilities in Treatment

services. Issues of efficiency of public health, perceptions about public health institutions, quality and accessibility of government health services, especially in rural health and for primary health needs, comparative costs of public and private health etc. combine to decrease the importance of public health institutions in curative health.

In preventive health, while no direct evidence is available, it can be assumed that public health bodies and schemes play a crucial role and perhaps are the only agencies involved in such tasks. NSS 52nd Round pointed out that in post-natal care, public hospitals and primary health centres took care of 77 percent mothers who went for post-natal care in rural and 74 percent in urban Madhya Pradesh. Out of the number of pregnant women registered for pre-natal care (42 percent), 78 percent used government hospitals or Primary Health Centres. If we take natal care as some kind of a surrogate for preventive care, it reinforces our assumption. Rural mother and child immunisation, and children's nutrition programmes

will also be almost entirely under government health systems.

5.1.1 Government Health Services

The Government health system is widespread in the state, based on norms of population coverage in setting up health care centres, hospitals and staff. The primary, secondary and tertiary health care facilities form the long chain from health sub-centres (SHC), the Primary Health Centres (PHC), and the Community Health Centres (CHC), as the chain of rural health institutions, and then move onto the civil and district hospitals, to medical colleges and speciality institutions. The hospitals cater to urban health care needs along with tertiary services for rural population.

The government health system has separate norms for rural and urban centres. In rural areas, there is a three tiered system consisting of sub-health centres, primary health centre and the community health centre. The three centres have been assigned particular roles and responsibilities in delivery and planning of health care, and are established based upon population coverage norms, decided nationally (norms are presented in the box). The three rural health delivery institutions mentioned above are referred to as primary health care delivery institutions. In urban areas, government provides for civil hospitals and district hospitals, and they are termed as secondary level health care delivery institutions. They are linked to the primary level institutions through provision of referral and managerial support. At the top of the three-tiered system

come the medical colleges and other specialised institutions, termed the tertiary health care delivery institutions.

5.1.2 Government Medical Infrastructure

The medical institutions in the undivided state of Madhya Pradesh along with population covered by them are given in the Tables 18.

The latest position of medical centres in the new state of Madhya Pradesh in 2001 is given in the Table 19. Overall there is at least one medical institution for every 5600 persons in the state, and the average coverage is one PHCs for every 37

thousand rural population, one SHC for every 5 thousand and one CHC for every 1.9 lakh rural persons.

Going by coverage norms there is a considerable gap in the number of Community Health centres, Primary Health centres and Health sub-centres. This gap and the requirement in these centres are given in Table 20. The rural health centres set up is still not as per the specified national norms. The shortfall in the crucial primary health centres and community health centres is 29 and 47 percent respectively. The Government of Madhya Pradesh, took steps to convert many PHCs into CHCs in late 1990's to somewhat solve the problem of lack of CHCs. The shortage figures if looked at district wise show that there are substantial inter-regional disparities in provision of health infrastructure.

For urban areas no clear norms are specified. Apart from the civil and district hospitals, most medical centres are situated in urban locations, especially the primary and community health centres, and the urban resident is serviced by these centres as much as by the hospitals. Further, the main secondary and tertiary health care units in urban areas also provide primary health care to urban residents. In spite of the fact that this put additional pressure on hospitals meant for secondary or tertiary level services, little attention has yet been paid to evolving a urban primary health care system.

Over the last many years another feature is the spread and reach of the medical institutions has been the lack of growth of secondary and tertiary level institutions. While there has been a large increase in SHC, PHC and CHC, the number of civil, district and speciality hospitals has been stagnant over a long period.

5.1.3 Access to Health Centres

Health centres have come up in rural areas based on population norms (see Box on Page 67) and have mushroomed rapidly in a bid to cover the entire state. However, with a population density lower than national average, health centres on population norms are too widespread geographically. In the

Source: Unpublished data from the Directorate of Health Services, Government of Madhya Pradesh

new state of Madhya Pradesh, health workers cover on an average six villages and have to cover a radical distance of 3.3 kilometres for delivery of primary health care services. All these figures are well above the national average. Similar distance problems are also associated with primary and community health centres.

What is the distance that people have to travel to access a Primary Health Centre? The data from area coverage indicate something. A close estimate is provided by NSSO round in 1993 for the undivided state of Madhya Pradesh. Only 16 per cent rural households had to travel less than half a kilometre to access a primary health centre, whereas 29 percent had to travel between 2-5 kilometres and forty percent had to travel 5-10 kilometres in 1993²⁰. The number of SHCs, PHCs and CHCs in Madhya Pradesh in 1993/94 were 11936, 1841 and 191, and this number rose to 12559, 1705 and 343 respectively. Putting PHC and CHC together (since many PHC were converted to CHC in MP in late 1990s), the numbers rose from 2032 to 2048, and this marginal increase would have made little difference to the problem of distance access.

5.1.4 Health Personnel

Personnel working in these medical institutions are the soul of the health care delivery system. Each type of centre has personnel on specified norms, and the norms are specified based

on the roles performed by the centre. The staff available and working in government health units is far less than what is needed. The data from the Directorate of Health Services shows that amongst class I doctors there is shortage of 28 per cent and the shortage amongst class II doctors is another 19 percent. Anecdotal evidence and evidence from field visits suggest that attendance by staff in rural health centres is poor, which further worsens the situation created by shortage of staff.

There are also district wise variations in personnel. If we just look at data on main doctors and health officers, while Bhopal, Gwalior, Datia, Morena, Damoh, and Tikamgarh have no vacancies, and another nine districts have less than ten per cent vacancies, eight districts have over thirty per cent vacancies (districts of Katni, Ratlam, Badwani, Jhabua, Shajapur, Shahdol, Dindori, and Sidhi).

Apart from this data, in Table 21b, we present data on required, sanctioned, in-position and vacancies for different categories of health personnel in India and Madhya Pradesh. Of the total specialists required in rural areas, there is a massive shortfall from what is required (over 90 percent), while this shortage is about 62 percent for all India (data pertains to 1998 and refers to the undivided Madhya Pradesh). In terms of doctors at primary health centres, the vacancy status was 17 percent of the sanctioned posts in rural MP.

5.2 Non Government Health Care

5.2.1 Private Health Services

As surveys have shown, private health services dominate the health sector as far as share of patients is concerned. These are characterised by private doctor clinics and nursing home facilities in cities and towns, and small doctor clinics at town and mofussil market centres and roving doctors, registered medical practitioners and *jhola chhaap* (footloose) health service providers. Very little information is currently available about the non-government health care delivery system in the state. There has, however, been a very substantial expansion of the non-government health care delivery system in the state in recent years, especially in large urban areas.

There is no effective mechanism to regulate private health providers by the state or by medical associations as a self regulatory exercise. There are very few norms existing if any, and the question of charges is normally market based, rather than any price regime for a public utility service. The state government has a hospital regulation act that may help in regulating the non-government health sector but this act is still to be enforced because of a stay petition in the court.

Very little is really known about the private health sector, apart from individual experiences, and sporadic assessments.

The rural private sector health providers work on network and word of mouth systems. The private doctor clinics and nursing homes lead the three major health providers. These clinics are usually situated at places where market congregations and visits are normal features. Often doctors also roam around on set routes and on set dates visiting small clinics in the countryside, or patients directly. Small operations, small emergencies, basic health care and medication are given here. In case the patients are serious and centres cannot handle them, they are referred to nearby government hospitals. These private health centres do very little as far as preventive health is concerned and there are growing doubts on the question of quality of care and health practices adopted.

The second category is of the Registered Medical Practitioners (RMP). RMPs are registered with the state government and are trained in basic health care. The RMPs perform two very crucial functions – one is that they are far more easily accessible to people than either the private doctors or the government health centres, and second they are pretty adept and quick in administering basic relief and basic curative drugs and injections. They are also more affordable. Regarding RMPs although they provide health care where qualified doctors have left a void, they can provide only second best treatment when it comes to major diseases and emergencies.

There is a third category of health providers, whom we term as the footloose health service providers or the *jhola chhaap* health providers. These should not be confused with the government's scheme of the Jan Swasthya Rakshak or the 'barefoot doctor' as they are termed. All over the countryside we find persons who have received some training or work experience in health care, or an employee of some years with a private doctor. Such persons often break out on their own and start providing health care, giving services for they are not trained and in anyway qualified. They provide basic health care, look after symptoms in patients such as fever, cold, aches, injuries etc., at their level. When they come across cases they are unable to handle, they may refer to them to local health care centres, both private and government. There is no data or information available on the scale of such people or their impact on health, but it is certainly a situation that warrants a closer look. In a way it also offers an opportunity to utilise such semi-trained or oriented persons in developing a cadre of well trained and oriented health watchers and basic service providers.

The basic need of the health care seeker and the objective of the health care provider is to administer effective, quick and easily managed health care, especially in rural areas and for slum dwellers. The need for quick cure amongst the poor often leads to use of treatments such as injections, high dosage of drugs for quick relief from symptoms like fever, body ache, weakness etc..

The urban health systems are clinic and nursing home dominated. Little is known about them, except popular perceptions, and that the momentum of collective experience calls for a quality and cost control regime in these health centres. These private health providers in urban areas service not only cater to the city well off, especially in speciality care, they also cater to both the urban poor and the rural poor who come to towns and cities in cases of serious illness and injuries.

Recently there has been some erosion of faith regarding the roles and practices of the private sector. Instances of unethical practice, negligence and corruption are on the rise. There has to be a controlling body of eminent and honest doctors that can act as regulators. The Government also needs to ensure on proper record keeping of cases seen by the doctors that can be monitored, build up crucial data on diseases, and patients, etc. The private sector has to be more actively involved in the health programmes and preventive health activities.

Two acts that directly pertain to quality control of the private health system are the Prenatal Diagnostic Techniques Act, 1994, and the Nursing Home Act. The first Act was enacted by the Government of India, and passed in the Parliament in 1994. The attempt is to put a strict control on prenatal diagnosis of the sex of the foetus, put a stop to female foeticide, and sex selection of the foetus etc. The recent Supreme Court

directives following alarming fall of juvenile sex ratio across India in the 2001 census data has put public attention to this problem. Over the last year, the Government of Madhya Pradesh has been rigorously implementing the PNDT Act across the state. To effectively implement the provisions of this act, the Director Public Health and Family welfare has been made the appropriate state level authority, with a direct system right down to the block level. The Act is being strictly implemented. Of the 720 private and government bodies, 571 have already been surveyed, and action has been taken against 15 of them till June 2002.

The Nursing Home Act which lays down guidelines for the nursing homes in Madhya Pradesh was passed by the Vidhan Sabha. However it could not be enforced as one of the district IMA put a stay petition in the High Court and stay was granted. Even after 2 year no final decision has been arrived at. The process of stay, the attitudes of private practitioners towards any form of regulation is a very poor reflection on the seriousness with which the private medical fraternity sees the issue of quality, and patients' rights.

The formal private health delivery system is mostly confined to large towns and the cities of the state. In smaller towns, the private health centres are usually clinics and small nursing homes. Secondly, all their services concentrate on providing curative hospitalisation services rather than health promotion and preventive health care services. There are no staffing and infrastructure norms for the non-governmental sector, resulting in a five star culture in the form of nursing homes in large urban conglomerations and in sub-standard health facilities when catering to the poor. Finally, the system shifts the focus from traditional medicine to that of the western medicine. The prohibitive cost of western medicines and diagnostic tests results in a comprehensive lack of access to these services of people who are not affluent.

A large major part of the informal private health services providers consist of those who are neither properly trained nor formally registered to provide health care services to the community, especially in small towns and rural areas. The space for such health service providers comes from the inability of government or private medical services to currently provide easily accessible and timely medical services to patients residing in remote locations or who are too poor to access such medical services. The unorganised and peripatetic characteristic of these providers makes it very difficult to put in a place any effective mechanism to regulate them. Although they do provide available and quick health service, these health services providers do more harm than good to people's health in the longer run.

5.2.2 Non Government Organisations and Health

There is very little organised knowledge of voluntary effort in health in the state. The state does have a history of hospitals, dispensaries and community health care projects in the

voluntary sector, which is growing over the years. These institutions and projects have been networking into associations that provide continuing education for its members and support them in other ways to carry out their activities. The networks include the Madhya Pradesh Voluntary Health Association (MPVHA); the Catholic Health Association of Madhya Pradesh (CHAMP) and others. In 1999-2000, these came together with other networks to participate in the mobilisation for the people's health assembly at Kolkata and Dhaka in December 2000, bringing to these assemblies the wealth of experience evolving at the grass-root level.

The state of Madhya Pradesh has been rich in social and peoples movements, which have created their own people's organisations, and some very good non-government organisations across the state. There is also wide experience in the state of collaborating with NGOs in core work in different social sectors. The most well know role of NGOs in health has been in the case of the Bhopal Gas tragedy.

The presence of such peoples organisations and NGO's calls for a need for the state to dialogue with the NGO sector and the social movements to harness their resources, commitment and capacities for the health of the people. This is a large potential still that should be explored and could become a major partner in the people oriented health policies of the state which seeks to empower the local elected bodies in health work.

5.2.3 Community Participation

Community participation has not been exploited in the health system. Technology dominated, technology solution dominated and technicians dominated, this system has actively sought to remain outside any interaction with the patients or any other groups in health delivery. It has been a domain issues, and since the health system has become almost totally technology intensive, it has made non-technical interventions even more difficult.

The role that communities have been able to seek has been with the coming of the new Panchayati Raj set up. The main role of community participation in Madhya Pradesh has been through the medium of the Panchayati Raj institutions. The district Zila panchayats were entrusted with some responsibility of managing local health set up. However in practise till now there has been very little interface between the health structure and people's representatives.

The latest amendments to the Panchayati Raj Act, popularly referred to as the Gram Swarajya amendments, have created substantial space for community participation and local control over health. The Act is perceived by many as an

instrument that will go a long way in decentralisation and devolution of statutory powers to the Gram Sabhas²¹. Under these amendments, a Gram Swasthya Samiti (Village Health Committee) has been set up. The Gram Swasthya Samiti has a multi sector mandate combining health, safe dinking water, sanitation and nutrition.

Another move towards involving the community has been the village health register. Every village now has a village health register, in which community is involved in registering information on JSR, Dai, immunisation, ANC, Family Welfare, Malnutrition, Availability of Safe Drinking Water, Service Providers, VHC, Depot Holder, 4 Vital Registrations, etc. The Gram Swasthya Samitis will be trained on the health registers. The current registers are based on information collected in 2002, and these shall be up dated annually.

6. NARROWING THE GAPS — THE MP HEALTH RESPONSE

6.1 Evaluation of the health system

In spite of the network of medical institutions, large army of medical personnel and many efforts in the health arena, the health status of Madhya Pradesh has been deplorable at best. The Rajiv Gandhi Missions system undertook a critical evaluation of the health system of the state, which is presented in the box²². This evaluation of the health system has been the background for the planning that went into the new Swasth Jeevan Sewa Guarantee Yojana of the state. The points of assessment show the current government thinking on health. The scheme is planning for a major shift in the management of a people health initiative, a like the Education Guarantee Scheme²³. In fact this critique of the health system has helped design elements of the new health scheme.

6.2 Initiatives in Health

In the arena of health, as all indicators and data show, Madhya Pradesh has a very long way to go. There are constraints of a difficult terrain, poor availability of funds in a backward and poor region, lack of medical personnel to adequately service the population, coupled with an under nourished and weak population. With no options to enhance funding in health in the near future, it calls for changes in the delivery strategies and delivery systems in the state. On the other hand, health is an area where quality of care and therefore quality of person delivering the service is utterly crucial.

To overcome some of these constraints, the State Government has undertaken some initiatives in health in the last eight years. These have been crucial both in what they have achieved and in what they have shows in way of institutional

21. There shall be a Gram sabha in every village. The Gram sabha will be a body corporate by the name specified thereof.

arrangements and designing of new ways. We will undertake a brief tour of these initiatives. In Madhya Pradesh we are also seized with two other problems – qualified doctors do not work in rural health centres, and either get themselves posted to urban centres or do not attend their duties, and second declining funds have turned many of these health centres inactive. Drawing on the experience of these initiatives and the two problems listed, Government of Madhya Pradesh has recently come up with a state wide initiative to tackle this. We will also then take a look at this initiative and what went into making it.

6.2.1 Selected Initiatives

It is important to list down some specific initiatives undertaken by the state government focussing on critical issues in health. In its effort at reducing infant related mortality and illness, the great success story has been the pulse polio campaign, undertaken nation wide. The success of the programme can be gauged from the fact that the state remained polio free in 2001 and throughout 2002. In fact in 2000, the State has achieved the international standards with regard to the technical aspects of this campaign. Based on community management, and participation, pulse polio campaign has shown an excellent manner of putting together the community and technology in achieving great success.

The recent efforts at ensuring full immunisation in the state has also achieved results. As mentioned earlier, the current rate of fully immunised children has touched nearly fifty percent, up from the 25 percent that the State would achieve till a couple of years back.

The State of Madhya Pradesh has initiated a State Illness

Assistance Fund for providing grants to below poverty line cases. Those identified as poor in the below poverty line surveys can now get benefit for 13 major diseases requiring surgery and treatment. A fund of Rs 10 crores has been kept in a nationalised bank for this purpose. The grants are sanctioned by a committee or by the Minister of Health in cases of emergency, and assistance ranges between rs 25000 to a maximum of Rs 1.5 lakhs.

6.2.2 RKS - The Rogi Kalyan Samiti

The State has initiated a scheme for citizen involvement in the management of State hospitals and health centres, following the successful experiment with a Rogi Kalyan Samiti in cleaning and refurbishing the Maharaja Yashwant Rao hospital at Indore. This scheme brings in citizens participation in health centre management, introduces levying user charges, citizen bodies controlling user charge funds, and maintaining the health centres.

Today, there are 750 hospitals and health centres across Madhya Pradesh that have a Rogi Kalyan Samiti out of a total of 1527 total centres. More than 7000 people are involved in the running and management of their health centres and hospitals as participants in RKS, and over the last five years, 53.2 crore rupees has been collected as user charges or raised by citizens as donations for their hospitals and health centres, and 40.2 crores out of this has been spent on improving hospitals, buying equipment, and medicines etc..

Many problems have also been identified with the RKS, but what has happened is that it has opened up the health system to participation of people in their management, brought a sense of ownership amongst citizens, with user charges it has broken the bogey that people will not pay for good services, and has provided a system with potential to be used to improve services of health units. It clearly shows that people's participation can definitely improve the status of public health delivery system.

6.2.3 Swasth Jeevan Sewa Guarantee Yojana (SJSGY)

The Swasth Jeevan Sewa Guarantee Yojana aims at establishing a system through which the participation of the community increases in the management of health services and effective utilisation of resources and facilities. The implementation of the Swasth Jeevan Sewa Guarantee Yojana will ensure the provision of a core set of services by the state government within a specified time frame. These services will include:

- One trained Jan Swasthya Rakshak in every village by December 2002.
- One trained birth attendant in every village by December 2002.
- Universal Immunisation.
- Three Ante-natal checks for pregnant women.
- Safe drinking water supply.
- Nutrition cover – Infants, children aged less than 3, pregnant and lactating women.

Jan Swasthya Rakshak Scheme - An Evaluation

The State Government started the Jan Swasthya Rakshak Yojana on 19th November, 1995, aiming to provide basic health care in every village of the state. The idea was highly relevant, aiming at creating a functionary capable of providing accessible, affordable and appropriate care right at the village level. As per the goals of the SJSYG, the presence of a trained Jan Swasthya Rakshak in every Village is to be ensured by Dec. 2002.

Presented below are salient findings of a review of the JSR scheme -

The common opinion about this scheme encountered is that it is conceptually sound and designed to meet a much-felt need.

There is an attrition rate in JSRs. Going by interviews and investigation in various blocks, it appears that quite a few of the JSRs are not fully active today.

Regarding process of selection, the JSRs are to be selected by the Gram Sabha. As far as the selection of JSRs earlier on was concerned, there were many cases when Gram Sabhas did not actually select the JSR. However, based on feedback, this selection procedure today has been ensured, and Gram Sabha now play an active role.

Gender wise, men heavily predominate. Educational status among most of trainees and trained JSRs was class 12th or above, while the lower ceiling for educational qualification to become a JSR was Class 12th pass. A few Private medical practitioners (2% of JSR trainees studied) have entered the JSR training process and pose the risk of providing an unhealthy role model for other JSRs. The education criterion for JSRs has now been relaxed to 8th pass, and preference is being given to candidates from SC and ST communities.

Methods of training include observation of clinical work in OPD, wards, lab or injection room. In classrooms the main method is reading of

the manual. In the earlier experience of JSR training, training aids were lacking, including the manuals. The trainers in most instances were the medical officer of the PHC/ CHC and may be the sole trainer; generally trainers had little time and mental space to devote for training and venue for training was also often inadequate. The feedback on improving training management, training curriculum and its design have been incorporated into the training now being given to JSRs.

JSR links with public health system was tenuous. Personal contact with ANM/MPW seems to be the unstructured link, with involvement in occasional assignments like Pulse Polio being the only content. There was no formal monitoring of JSRs either in form of regular feedback from them or communication to them from the PHC. This has changed now, and in the tenth plan, the government plans to network with JSRs under different programmes, especially those related with primary and community health.

It may be said that the scheme has major potential because of the vast need for available and affordable care in a backward state with far-flung villages. The evaluation report stated that the scheme lacked a 'system framework' and the report as well as most stakeholders were of the opinion that improvements were necessary. The evaluation report mentions "Redesign of the scheme with educated involvement of users, analysis of processes, better support systems, slower pace could provide a viable option for village level primary care. Also there is a need to institute controls including control by users, better training, continuing education and concerted effort on National/ State Health Programmes." Most of these recommendations have been put into effect under the overall umbrella of the SJSYG (some of these elements have already been mentioned above).

- Proper sanitation facility – solid waste management and waste water disposal.

Training of Village Health Committee

The Gram Sabha members of every village will be given the responsibility to constitute a health committee of stakeholders, called the Gram Swasthya Samiti to carry out this plan at the village level. This committee should have at least 12 members out of which fifty percent should belong to Scheduled Castes, Scheduled Tribes and Other Backward Classes (2/3 SC/ST and 1/3 OBCs) and thirty three percent women members.

With the support of the Rajiv Gandhi Community Health Mission, number of Master Trainers and Block level trainers have been trained and now they are training VHC members across the state.

Community Health Activists is SJSYG – Jan Swasthya Rakshak (JSR) and Trained Birth Attendant (TBA)

The State Government started the Jan Swasthya Rakshak

Yojana on 19th November, 1995 to provide basic health services in the rural areas through trained personnel who can treat minor ailments, and to develop a cadre of people who can also assist in the implementation of national health programmes. This scheme ran in the state for nearly five to six years. There is not very much known regarding the actual effectiveness or impact of the JSR scheme, but the general impression from the field has been that they can be fairly effective and possess immense potential as an army of para-professionals. To fill in the information gap on JSRs, and to strengthen this programme the state government got an evaluation conducted of JSRs, which has thrown light on the JSR scheme and what potential lies in this scheme for the state (see box).

Building on the JSR scheme and drawing action points and guidelines from evaluations of the JSR scheme and feedback from the field, the state government has brought them under the Swasth Jeevan Sewa Guarantee Yojana, the comprehensive community health scheme. As per the directions of the state government in response to the new initiatives planned in the states health delivery set up, the presence of at

least one trained Jan Swasthya Rakshak in every Village has to be ensured by December 2002. Under this initiative, out of the total 52352 villages, JSRs are to be made available for 42816 villages. Till date 29371 JSRs have been trained, and another 10069 are undergoing training. This just leaves 3376 more JSRs to be trained to achieve the target of one JSR for every village.

Along with JSRs, the state government has also decided to ensure at least one trained Dai for each village by the end of the year 2002, again a part of the Swastha Jeevan Sewa Guarantee Yojana. Till date 41928 Dais have been trained and another 1466 are under going training. Another 9027 Dais are still left to be trained. The main objectives of the Dai programme is to provide ANC checkups, identify high risk pregnancies and counselling on nutrition and safe delivery; to conduct safe deliveries; to identify danger signs during delivery and appropriate timely referral.

7. IN CONCLUSION

The effort through the Swastha Jeevan Sewa Guarantee Yojana is to move towards a rights-based framework for delivery of basic health care. It is expected that the Swasthya Jeevan Sewa Guarantee Yojana will leverage the management of health sector towards district and below district level management. The State Government has also set up a State Health Society chaired by the Chief Minister as a multi sectoral forum with experts and sectoral heads represented on it so that issues of health can be addressed in an integrated framework. This has been extended to the Districts as District-level Health Societies.

The Village Health Society at the Village-level, the District Health Society at the District-level and the State Health Society at the State level are key multisectoral management units to address health issues. It is proposed to build health action from below to address the major challenges that Madhya Pradesh faces in public health.

Livelihood: Crisis and Growth

Livelihood is the most defining and determining need for a human being. A livelihood in many ways is almost the entire gamut of issues covering life. For a decent level of human development, a person and her household requires a source of sustainable livelihood that ensures access to basic resources and access to basic amenities to survive well. Employment, sustainable, gainful and one that ensures a basic level of remuneration is essential for all human beings. Employment by itself is not a complete condition for a sustainable livelihood – it is the character of employment – its regularity and periodicity, level of income or benefits from it, and security of employment, and ensured basic rights of employment.

In this chapter we will take a look at the question of employment and un-employment in Madhya Pradesh, and a brief look at the conditions affecting livelihoods apart from employment.

INTRODUCTION

People need sustainable livelihoods to ensure that they and their dependants are able to have access to basic resources and basic needs to ensure a life of dignity, decent living, save from disease, hunger, squalor, poverty, deprivation and denial of basic rights. This means that livelihoods ensure nutrition, lack of hunger, ability to access basic health, give children basic education, ability to afford a decent shelter, clothes and resources for necessary daily and social expenditures.

Livelihoods, in many ways would then be a sum total of both the employment portfolio of a household and what it earns in monetary terms, or as services and goods, and what a household receives as entitlements being a citizen of the state, or gram panchayat. Dealing with both these aspects, we will concentrate more on the status, trends, issues and action on livelihoods of people and lesser on the livelihoods provisioning by state, or other agencies.

The most crucial need for a sustainable livelihoods for an individual or household is employment, or being gainfully employed over a period of time, that ensures a level of remuneration satisfying basic needs and a quality of life. What is this level of earning/ income/ inflow of money goods or services to a household that ensures such a standard is difficult to

estimate, but there are a few ways of assessing these. The most widely used measure is one of income poverty. Households subsisting below this level of income (calculated using expenditure estimates), would be the most vulnerable and deprived households. The other measures would be employment figures, employment in different categories.

Households involved in labour, without possession of land, households with very little land (marginal farmers, or even small farmers owning poor quality or un-irrigated lands), households with just one member employed (especially in rural areas, and employed as labour, or very small trading or wage employment), persons employed in activities facing crisis/ shrinking/ decline and so on. On the other hand, evidence of persons gainfully employed, and being able to sustain their households would be available from figures of employment from census and other surveys, and their sustainability can be ascertained from ownership/ operational rights over land, factors of production, employment in salaried positions, self-employed in units of some size, employed in growing/ emergent clusters, and so on.

Other measures or indications on the state of livelihoods are the issue of ownership/ access to productive capital/ assets. Ownership or access to land, access to forest and forest produce, including usufruct, access of natural resources for livelihoods dependent on them (pond and lakes for fish folk, access to clay for the potters, access to dead carcass for leather flayers, etc.), access to water.

The chapter on livelihoods would attempt to understand the nature and sources of employment in Madhya Pradesh, and the quantum or numbers of persons belonging to various categories of employed, asset holdings and so on. This would give a precise idea of the quality and quantity of the livelihood issue in the state. The first section would therefore deal with the magnitude of employment, problem of un-employment and under employment. The next section will deal with aspects affecting livelihoods, where we deal briefly with the economy of the state and some of the crucial issues of ownership, growth areas, the institutional framework for livelihoods and last the action in livelihoods promotion in Madhya Pradesh.

The Census of 2001 has put the population of Madhya Pradesh at just over six crores, showing a growth rate of over 24 percent over the decade. This puts the annual increase in population at 2.2 percent or 13.3 lakh persons per annum. Let us assume that the annual growth rate would remain the same for the first few years of this decade, and persons added in the last two decades now need jobs or employment. The Worker Participation ratio of MP in the productive ages (15 years to 59 years) is presented in the Table 1(a) below.

With the same level of main and marginal workers assumed in the work force as estimated by Census for Madhya Pradesh in 1991 for the different age groups, we see that on an average at least nearly ten lakh jobs will be required every year for the workforce. This in many sense would be the employment challenge for Madhya Pradesh – to ensure gainful and sustainable employment to ten lakh people every year. Expanding and providing opportunities for productive employment is central to sustained poverty reduction, as labour is the main asset for majority of the poor.

Madhya Pradesh has a very large population dependant on agriculture, there is a gradual casualness of labour, and a large number of persons are employed in sectors which are not high growth. The challenge of employment is then not just new jobs, but to make existing livelihoods stronger, and sustainable. In the following section we will attempt to look at the employment scenario and trends for Madhya Pradesh in

the light of where is this employment coming from, what could be the characteristics of this employment in terms of security and sustainability of livelihoods and what would be the future scenario.

The last decade has seen many changes in Madhya Pradesh, including a high rate of growth of the economy. How much of this has translated into an impact on peoples livelihoods is what we need to see. Evidence, both from peoples field experience, and from studies and data shows that employment opportunities created is inadequate inspite of rapid growth. The general perception in the country is that although GDP growth has accelerated, it has not been accompanied by a commensurate increase in employment leading to a worsening in the employment situation in the post-reform period. These considerations have led to a demand for greater attention to the employment objective¹. There is also a concern on youth and educated unemployment as increase in it will lead to waste of human resources and social tensions.

EMPLOYMENT SITUATION AND TRENDS

Information on the level of employment in the state is derived from both census records and data based on National Sample Survey (NSS) data.

As shown below, employment in Madhya Pradesh is largely unorganised, rural and non-industrial nature. Casual

labour forms a substantial part of the total labour force and has been growing in the last couple of decades.

Work participation rates

Worker-population ratios provide an idea about the participation of population in economic activity². Table 1(b) provides the worker population ratios for the period 1983 to 1999-2000. The participation rates in rural Madhya Pradesh increased in 1993-94 before declining significantly in 1999-2000. The decline occurred for both rural and urban areas. The worker-population rates for rural and urban Madhya Pradesh are much higher than for rural or urban India, and this trend has been maintained over the last many years. The over ten percent difference between the WPRs of India and Madhya Pradesh shows the need for large number of people to be involved in the workforce in Madhya Pradesh. This quite clearly shows that the remuneration received from

2. In order to capture the complexities of the employment situation in a predominantly agrarian and unorganised economy like India, the estimates of employment and unemployment by NSSO are derived on three concepts, Usual Status (US); Current Weekly Status (CWS) and Current Daily Status (CDS). The three concepts are based on three different reference periods for ascertaining the activity status of a person. Under the Usual Status concept the reference period is one year and the activity status of a person as employed, unemployed or out of labour force is determined on the basis of activity pursued by him for the major part of the year. On the CWS criterion, a person is considered as employed or unemployed if he has worked or has not worked though was available for work, respectively, even for one hour during the week. Under the CDS approach, the unit of classification is half day. Under this approach the person days are distributed by activity category during an average week. A deficiency of the present time criterion based estimates of employment is that one gets to know little about how well employed (income etc.) are the persons who are seen as employed. They also do not provide the multiple activities by persons/households.

Table 3: Percentages of Workers among Children across States

	Rural		Urban	
	5-9	10-14	5-9	10.14

Source: NSS 50th Round

most livelihoods in Madhya Pradesh are low, and many more people in households are required to be working to maintain themselves.

In the trend of a decline in WPR over the years, the survey results for 1993/94 do show a somewhat different picture, where rural WPR went up from 1987/88, and then reduces again in 1999-2000 in Madhya Pradesh and India.

We see the participation rates for males and females for the 1990s in Table 2. It shows a decline of rates for both males and females in 1999-00 as compared to 1993-94, except in the case of urban males.

Age specific worker participation rates apart from Census are also available from NSS. From these estimates let us first take a look at children working. Looking at the incidence of children working captured by NSS estimates presented in Table 3, in Madhya Pradesh an approximate 17 percent of rural children in the age group ten to fourteen years were working. The

rate of rural child workers is the fifth highest amongst the major states of India. In urban areas on the other hand, the rate of children working is relatively much lower at 2.3 percent.

Employment growth

The number of employed and worker participation rates show the current status. Trends in employment growth and the diversity and distribution of work force are a far more crucial and relevant indicator of the state of livelihood. What is happening in employment or livelihoods in the state in the last decade or so? Table 4 shows that employment growth declined drastically in the 1990s as compared to the period 1983 to 1993-94. In rural Madhya Pradesh, rate of growth in employment declined from 2.49 percent per annum to 0.69 percent per annum.

What are the reasons for the decline in employment growth in the 1990s? One of the reasons could be decline in participation rates of younger age groups. A decline in the participation rates of younger age groups is expected as younger people try to gain access to education and stay in school for a longer period. Rising income levels also reduce the pressure to enter the labour market. However, it may be noted that participation rates declined for all age groups although the decline was shaper for younger age groups. Another explanation given is that labour force growth itself

Table 5: Distribution of Operational Holdings and Area by Size Classes: 1970-71 and 1995-96

Year	Marginal	Small	Semi-medium	Medium	Large
No. of holdings (in lakhs)					
1970-71	16.8	8.9	10.7	11.7	4.9
1995-96	22.8	16.5	13.8	9.5	2.0
No. of Holdings (%)					
1970-71	31.8	16.8	20.1	22.0	9.3
1995-96	35.2	25.5	21.4	14.7	3.1
Area (in lakh hectares)					
1970-71	7.2	13.2	30.9	73.5	87.2
1995-96	11.4	24.4	39.3	57.9	32.9
Area (%)					
1970-71	3.4	6.2	14.6	34.7	41.2
1995-96	6.8	14.7	23.7	34.9	19.8

Note: Marginal (below 1 hect.); Small (1.0 to 2.0 hect.); Semi-medium (2.0 to 4.0 hect.); Medium (4.0 to 10.0 hect.); Large (above 10.0 hect.)

1993-94 to 1999-2000	0.69	0.67	2.94	1.34

has declined. In other words, many are joining the category of 'not in the labour force'. It is not, however, clear why labour force participation has declined. It is possible that economic opportunities have not increased in the post-reform period inspite of higher growth.

PROLIFERATION OF MARGINAL AND SMALL FARMERS

The number of smaller holdings and area under them has

been increasing, a pointer to fragmentation of the already meagre land holdings of small and marginal farmers upon division, and many semi-medium and medium level land holdings slipping into marginal or small land holdings with fragmentation due to multiple divisions. The data presented in Table 5 show that the share of marginal and small farmers in area and number of holdings increased over time from 9.6 percent in 1970-71 to 21.5 percent in 1995/96, an increase of seventy five percent in terms of land under small and marginal farmers. The data for 1995-96 show that around 61 per cent of the land holdings belong to marginal and small farmers.

There are 39.3 lakh small and marginal farmers in the state and they are mostly underemployed. The size of land holding of these farmers (average land holdings of small and marginal farmers was 0.91 hectares in 1995/96) is uneconomical and majority would also be working as agricultural or casual labourers to supplement their incomes from farming to sustain their livelihood. In between 1981 and

1991 there was no significant shift of workers to agriculture labourers. However, data from NSS rounds report that there is a gradual casualisation of the workforce, and the number of casual labourers in MP went up from 32 percent male and 38 percent female casual labourers in 1993/94 to 37 percent male and 44 percent female casual labourers in 1999/2000.

PRODUCTIVITY OF LAND

On livelihoods dependent on agriculture, the quality and productivity of land has a significant effect. The productivity of agricultural land is at the heart of income earning opportunities, and the well being of the people is dependent on the yield from agriculture.

If we look at the Table on agriculture productivity it gives a fairly good idea of the regional dimensions of the strengths of agriculture, a surrogate measure for basic well being of those working in farm activities. There are identifiable regions

Subsistence (Marginal and Small) Farmers (landholding between one acre to five acres of land) – A study of households in Narsinghpur, Hoshangabad, Ujjain and Neemuch

Marginal and small farmers normally till their own till land, their own khud kasht holdings and many amongst them also take land on lease, owning two to four acres of land, and on average lease two to three acres of land on batai. Every subsistence farmer wants to grow food for tiding over at-least six months' worth of consumption needs for his/her family, and it was found that they were able to grow 12-15 quintals of food grains per annum. Produce grown by them includes edible oils, like linseeds, sesame, rape seeds, *taramira*, and also some coarse millets like tapioca (kodo), sama and pulses like *arhar*, *mung* and *urad*, and some vegetables in the kitchen garden. Most subsistence level farmers (about 90%), reared one or two bullocks for tilling, renting them out and for dung, for manuring the fields. The requirement of dung for one acre of land is about ten cart-loads and one buffalo/cow produces about ten cart-loads of dung per annum. A subsistence farming family (of seven members) needs about four acre worth of agricultural produce for meeting six months of domestic needs. This requires four heads of cattle, which generally consists of a cow, one or two calves and a pair of bullocks. However, the study team found that in most cases, the subsistence farmers had access to only two to three acres of land (either their own land or sharecropped land). They also do not own any other assets of significant monetary value like bullock carts, mechanical devices etc. though they do have implements like ploughs, levelling planks etc.

The subsistence farmers have to complement the agricultural yield with wage labour (local as well as migration), gathered residuals (from harvested fields) and other subsidiary non-farm occupations (e.g., service, pottery, hair-cutting, carpentry, fishing etc. depending on castes and available choices). Fishing is an important livelihood source for communities (especially *kevats* or *dhimars*) living near water reservoirs. Another activity undertaken by such farmers is collection and sale of non-timber forest

produce and sale of head loads of fuel wood in the nearby markets.

Households belonging to this category (especially the SC/ST ones) are often bound in exploitative relationships (as reflected in low wage payments, harassment of women and harassment of school-going children) with the dominant segments i.e., the larger farmers.

In Bundelkhand and Chambal regions livelihoods of this category are subsistence livelihoods. In districts like Narsinghpur, Hoshangabad, Ujjain and Neemuch – some of the farmers with 4-5 acres of land might even belong to marginally surplus livelihoods, helped mainly by the black cotton soils of Malwa region and ample water for irrigation.

One of the chief features of this group is its perpetual state of indebtedness to the local moneylenders. The debt burden on the small and marginal farmers is lesser than on the landless labourers provided (i) the former have not faced any major health problems in which case they are compelled to avail loans from the local moneylenders, (ii) The family does not have more than one daughter to be married and (iii) The family has at least four bighas of irrigated land which are dual cropped and the family grows vegetables and other cash crops on that irrigated land.

The small and marginal farmers stand a much better chance of getting some land to cultivate on share cropping basis than the landless because they have wherewithal to undertake farming, whereas the landless would neither have bullocks and agricultural inputs nor much of prior experience in farming. The details of the agriculture labour and non agriculture labour are more or less the same but for the fact that the small and marginal farmers remain fairly busy in their own fields and therefore are unable to work as much in the field of others as agriculture labour as the landless in the village. This group is more likely to have cattle but the milk produced is invariably used more for self-consumption than for sale.

of low agricultural productivity in the state. In the case of major Kharif crops, the low productivity belt is largely concentrated in the Rewa and Sagar Divisions, as well as three Nimar districts. In the case of major Rabi crops too, there is a well-defined low productivity belt, which is, however, slightly different from the low productivity belt defined for Kharif crops. In Rabi, the districts at the bottom in terms of yield per hectare fall entirely in the Rewa division and the southern tribal districts of Jabalpur division. The three districts of Nimar record comparatively high levels of produc-

tivity in Rabi, ranking at No. 5,6 and 14 in the state out of 45 districts.

Some of the differences may be explained by Irrigation Intensity. If we consider the districts with irrigation intensity of less than 20 per cent, we find, in addition to the district of Jhabua in Western MP, a clear contiguous geographical belt in Eastern MP encompassing the districts of Panna, Rewa, Shahdol, Sidhi, Umaria, Dindori, Mandla and Seoni. These also happen to be districts in which the productivity of Rabi crops is relatively low. The Nimar districts are comparatively

Non Timber Forest Product in Madhya Pradesh

Name of NTFP	Botanical Name	Uses	Month of Collection
Mahua	<i>Madhuca indica</i>	Commercial, Medicine, oil	June– July
Kanji	<i>Pongamia pinnata</i>	Non edible oil	Jan – Mar
Mahua Phool	<i>Madhuca latifolia</i>	Beverage	March – April
Areetha	<i>Sapindus emarginatus</i>	Soap	Feb – April
Aonla	<i>Embelica officinalis</i>	Medicine/ Trifala component, fruits very rich in Vitamin C.	Nov – Jan
Baheda	<i>Terminalia bellerica</i>	Medicine	Mar – May
Gond Dhawra	<i>Anogeissus latifolia</i>	Gum	Feb – June
Gond Salar	<i>Boswellia serrata</i>	Gum	Mar – June
Gond Karaya	<i>Sterculia urens</i>	Gum	Mar – June
Gond Babul	<i>Acacia nilotica</i>	Gum, medicine	Mar – June
Gond Khakra	<i>Butea monosperma</i>	Gum, dye	Mar – June
Kali Musli	<i>Curculigo orchiodes</i>	Medicine	Sep – Oct
Safed Musli	<i>Cholophytum tuberosum</i>	Medicine	Sep – Oct
Satavari	<i>Asparagus racemosus</i>	Medicine	Sep – Oct
Kemach Beej	<i>Mucuna purita</i>		Oct –Dec
Ghat Bor	<i>Zizyphus xylopara</i>	Fruits edible	Mar - Apr
Bel Guda	<i>Aegle marmelos</i>	Diarrhoea, heat –stroke	Apr – Jun
Gond Godal	<i>Lannea cormondolica</i>	Gum	Mar – Jun
Shahad	<i>Apis dorsata</i>	Medicine/ Food	All year
Mom	<i>Apis dorsata</i>	Commercial	All year
Gond Khair	<i>Acacia catechu</i>	Gum	Mar – Jun
Lac	<i>Tachardia lacca</i>	Jewellery, sealing	Mar – Jun
Baheda chhal	<i>Terminalia bellerica</i>	Medicine	Mar – May
Adusa	<i>Adhatoda vasica</i>	Medicine	Jan – Jun
Gokharu	<i>Tribulus terrestris</i>	Medicine	Sep – Oct
Ratanjot	<i>Jatropha carcus</i>	Medicine, Oil	Sep – Nov
Aswagandha	<i>Withania somnifera</i>	Medicine	All year
Marorphali	<i>Helecteres isora</i>	Medicine	Oct – Dec
Sankh Pushpi	<i>Evolvulus aisiniodes</i>	Medicine	Sep – Nov
Tendu Patta	<i>Diospyros melanoxyton</i>	Bidi making	Apr – May
Chironji	<i>Buchanania lanjan</i>	Food/ Dry Fruit Nuts	May – June
Bark of Khakra	<i>Butea monosperma</i>	Fibre for ropes	June – July/All the year
Kosa/tassar	<i>On Terminalia tomentosa</i>	Cocoons for tassar silk	March – May
Mangoes	<i>Mangifera indica</i>	Edible Fruits	June – July

better off in terms of irrigation intensity, and this possibly links up with the improved agricultural productivity in Rabi.

The implication of continuing low productivity in the eastern region of the state is that income earning opportunities from agriculture would be limited. There is a need to bring this region into focus and look at ways of making a concerted effort to increase irrigation intensity, as well as undertake watershed development in a big way. Simultaneously, non-agricultural land based activities need to be considered. This applies also to the pockets such as Jhabua and Betul in which similar conditions prevail. On the other hand, in the case of relatively better irrigated districts in the Nimar region, technical solutions should be sought to enhance productivity of Kharif crops.

FOREST BASED LIVELIHOODS

Nearly forty percent of the states villages are either forest villages or are situated close to forests and forests play a significant

role in the livelihoods of people in such villages. It is difficult to estimate the exact number of people dependent to some extent on forests, since data captures by either the census operations or by NSS do not capture employment sources that give support for brief periods. In case of persons collecting Non Timber Forest Product (NTFP), the period of direct persons days of employment is not very significant, say ten to fifteen days to a month or so at the maximum overall in an year. But the forest produce plays a significant role in peoples lives is very evident from the three brief case studies of villages presented here. A list of some of the main NTFPs collected in Madhya Pradesh is also presented in the Box on NTFPs.

The regime governing forests and peoples rights over forests is highly regulated and governed by national acts. In Madhya Pradesh the large population that depends on forests for incomes and consumption has had to contend with such laws, but there has also been a gradual shift on part of the

Livelihoods of Non-Timber Forest Produce (NTFP) Collectors

A study of 53 households living on the outskirts of the Panna Reserve Forest in Panna district, revealed that the villagers earned a total annual income of Rs. 3.23 lakhs approximately through collection of NTFPs. They plucked tendu leaves worth Rs. 1.5 lakh which were sold to tendu patta co-operatives, collected mahua leaves and nuts worth Rs. 98,000 which were either sold in haats or to traders in barter and sold fuel wood to the Majhgaon Diamond Mine Employees Colony worth Rs. 65,000 annually. While these households also had other income sources, the NTFP income of the households accounted for the 85 % of the total income of 46 households in the village. On an average 2.7 persons from 46 families were engaged in NTFP collection and marketing. Each family on an average earned Rs 9450 from the forests and total incomes accruing to them annually was Rs 11,000/-

In another village of 83 households in Jhabua district, 68 households draw approximately 35 percent of their total annual income from forest produce. This village of mixed caste households has two JFM committees. The nearby dry deciduous mixed teak forest has about 50 percent vegetation density. All the big trees are below thirty years of age. It has about 60 % *Tectona grandis* or sagwan population, besides, khakra, sirish, bamboo, neem, tendu, pipal, dhawra, mango, jamun and some piloo trees. There is a big undergrowth of bers, khakra, small khajoor, Adhatoda or adusa, gobar-sungha and ratanjot plants.

In this village, details of NTFP quantity collected and value realised by villagers is presented below.

Mahua Flowers	Mahua Seeds	Tendu Leaves (Bags)	Gums
5261 Kg.	3916 Kg	163	1.5 Qt. for Rs. 2250
@ Rs. 8 per Kg.	@ Rs. 10 per Kg	@ Rs. 400	Value realised per Kg.
= Rs. 42088	= Rs. 39160	= Rs. 65200	per bag and amount in Rs.
Total income realised annually from the NTFPs = Rs. 1.49 lakhs approx.			
Average family income = Rs. 2180			

Besides the sales through village committees each of the NTFP collectors sells some small amounts of NTFPs individually in haats for about Rs. 800 per annum. Hence the total average income through the NTFPs is Rs. 2980 or Rs. 3000 per household per annum.

Forest Produce Gathering in Mahakaushal

Collection of Non-timber Forest produce or NTFP includes food, fuel, fodder, tendu leaves, Mahua flowers and seeds as well as Chironji or Achar seeds. Fruits like mangoes, custard apples, guavas and small berries are also abundant in this area. Some other forest produce gathered are the tuberous roots of indigenous trees which are used for eating/ consumption, some green leaves of grasses and herbs used as vegetables and fodder and leaves of Khakhra (*chevla/dhak*), used by the ginger cultivators to cover the tender plants of ginger and for making plates and bowls by sticking the leaves together with tiny wood pieces or scraping. For those people who have access to forest and NTFP, say, typically, a household of seven persons, with four of them engaged in NTFP collection, is able to collect tendu leaves worth 200 rupees per day for seven to ten days in a year i.e., an annual income of fourteen hundred to two thousand rupees. Similarly, for mahua seeds and flowers, the collectors get about the same amount of money over 30-40 days in a year. On an average, they collect mahua flowers and seeds from about 4-5 trees and each mahua tree yields about Rs.500/- worth of NTFPs per year. Hence Rs. 2000-2500 is the average income from mahua. Other NTFPs and fuel wood, fodder and foods fetch a household with four collectors yield worth about Rs.1000/- per year. Hence on an average, a household with four collectors, collects NTFP, worth Rs.4400 to 5500 per year.

It needs to be stressed that all households in a village do not collect NTFPs. It is the people at the subsistence level of livelihood (generally SCs and STs), who collect NTFPs.

Source: Fieldwork by Project Team

government to grant more rights to people with regard to basic needs from forests, and to bring people more and more into management of forests. Rights of nistari were granted to people way back in 1970s. Madhya Pradesh today also has a large programme under Joint Forest Management (JFM). The impact or the results of the JFM programme have certainly been beneficial as far as the forest cover in the state is concerned. The latest satellite imagery released by ISRO shows that the forest cover in the state has increased over the last five years by 376 sq kms. Much of the credit for this could go to the effective role played by JFM groups in the state. However it must be kept in mind that satellite imager data does not show the quality of forest.

The crucial role that forests play in the lives of millions who either reside in forests or in villages within a five kilometre periphery of the state is significant. In spite of efforts such as grant of nistari rights, and the JFM programme, the relation between people and the forest management and regulatory regime under the acts has sometimes led to conflict between villagers and forest authorities.

ORGANISED EMPLOYMENT

Most of the social security laws in the country are applicable only to organised workers. In Madhya Pradesh, there were 21.89 lakh workers in the organised sector in 1997. If we just compare the workers in the organised workforce with estimates of total workers in the state, the percentage share of organised workers to total workers was just about 6.2 percent in 1993/94, and should be around six percent even today. Unorganised workers form around 94 percent of the total workforce in the state. The vast majority of the workforce including agricultural labour, construction labour and labour in traditional leather tanning, forestry, fishing, bidi rolling, household industry etc. as also village artisans, urban informal workers coming under the general categories of unorganised sector are wholly out of any reckoning in the various statutory

laws in the country. These workers are unprotected by legislation and most of them tend to be poor.

Employment in the organised sector: Public and private sector

Much of the concern about the lack of employment reflects a strong preference for employment in the organised sector. The jobs in organised sector generally provide much higher levels of wages than in the unorganised sector and also provide much greater job security and other benefits. The available information summarised in Table 6 shows that it increased from 12.88 lakhs in 1975-76 to 21.89 lakhs in 1997-98.

The Table also shows deceleration in growth of employment in organised sector over time. In the later part of 1990s, the growth rate was around 0.9 per cent per annum. Although, in the two years between 1995-96 to 1997-98 there has been a sudden jump in private sector jobs, thereby pushing up employment overall in the organised sector. But this rise appears to be more of annual fluctuation feature, since other evidence does not point to such a massive private sector growth in recent years.

One of the main reasons for the lower growth in organised employment is the slowdown in public sector employment in the 1990s. Public sector employment has actually declined from 1990-91 to 1997-98 in the state, and impacts growth rates for organised employment, since its share has been around a third of all organised sector employment. The higher growth rates in private sector employment, averaging around 3 percent per annum in 1980s, and over four percent in 1990s has not really been able to compensate for loss of workforce in public sector.

CHANGES IN SECTORAL DISTRIBUTION OF WORKERS AND RURAL NON-FARM EMPLOYMENT

Here we examine diversification in terms of shifts across

Table 6: Employment in Organised Sector

Years	Public	Private	Employment (in lakhs)	Compound Growth Rate	Public	Private	Total
1975	952564	335904	1288468	1975-76 to 1980-81	2.87%	5.28%	3.52%

broad sectors in rural areas for the period 1983 to 1999-00. Diversification of rural livelihoods is important for several reasons. At the economy level, the demographic pressures on land have been increasing significantly in the state. With its share of around 35 per cent in GDP, Agriculture and its allied activities has to bear the burden of 75 per cent of rural workers. Therefore, labour productivity has been low in agriculture. Urban areas have their own problems of demographic pressures. As a result, rural non-farm sector becomes an escape route for agricultural workers. In order to increase wages in agriculture and to shift the workers to more productive areas, rural diversification is almost the only avenue open.

While examining the trends, usually the numbers for the year 1987/88 are disregarded as that was a period of severe drought affecting most parts of the country, though its impact on Madhya Pradesh was not so severe. Still the dip that is seen in rural workforce in the primary sector in this year is directly a result of drought and not of rural workforce diversification. The percent of workers in primary sector in rural Madhya Pradesh has been much higher than that of all-India rural in 1983 and for all subsequent years for which data is presented. The gap between the share of primary sector workers in rural India to the share in rural Madhya Pradesh has also been higher in the 1990s than in the 1980s. This shows that the change in workforce diversification has been much faster in other parts of India than has happened in Madhya Pradesh.

Table 7: Broad Sectoral Distribution of Workers in Rural M.P. and India

Year	Rural M. P.			Rural All India		
	Primary	Secondary	Tertiary	Primary	Secondary	Tertiary
1983	90.7	4.8	4.6	81.5	9.0	9.4
1987-88	87.9	6.8	5.3	78.3	11.3	10.3
1993-94	90.4	4.5	5.1	78.2	10.2	11.5
1999-2000	87.5	5.8	6.9	76.1	11.3	12.5

Source: NSS Rounds

There has been a gradual expansion of the tertiary or services sector in Madhya Pradesh, with manufacturing related activities growing very gradually in rural Madhya Pradesh (see Table 7). In fact, secondary sector share of employment even dropped between 1983 and 1993-94, only to pick up from then to 1999-2000. The percent of workers in secondary sector in rural Madhya Pradesh was 4.8 per cent in 1983 and 5.8 per cent in 1999-2000; that in all-India it increased from 9 per cent to 11 percent during the same period. In 1983, the tertiary sector's share in the state was half of that of all India and has remained so even today.

Table 8: Percentage of Non-Farm Employment in Rural Madhya Pradesh and Rural All India

Year	Males		Females		Total	
	M.P.	All India	M.P.	All India	M.P.	All India
1983	12.6	22.4	6.2	12.2	7.2	18.4
1987-88	14.9	25.7	9.5	15.3	12.7	21.6
1993-94	12.7	26	6.2	13.9	10.9	21.7
1999-2000	15.8	28.7	8.6	14.6	12.9	23.8

Source: NSS Rounds

Table 8 shows that the percentage of rural non-farm employment in Madhya Pradesh increased significantly from 7.2 percent in 1983 to 12.7 percent in 1987-88, and thereafter it tended to stagnate or show a decline. This is true for both males and females. In other words, jobs in the rural non-agricultural sector in rural areas were created very slowly. Since rural labour absorption in the non-farm sector is crucial for poverty reduction, what has happened in Madhya Pradesh in the 1990s with regard to non-farm employment creation is disturbing. When we compare the non-farm employment of Madhya Pradesh with India, while a quarter of employment across India is in this sector, it is about half of that in Madhya Pradesh. Even the Census 1991 figures on rural non farm employment supports this. In 1991, the share of rural non-farm employment to total employment was the lowest in Madhya Pradesh amongst all states.

Trends at one-digit level

NSS provides data at different levels of desegregation based on National Industrial Classification (NIC). Table 9 provides the trends in employment in Madhya Pradesh at one digit level. In comparisons over time, we ignore 1987-88 as it is a drought year. As mentioned above the increase in rural non-farm employment has been slow except a jump between 1993/94 and 1999/2000, when workers in this sector in rural areas went up by 25 percent. The increase is mainly concentrated in construction, and trade.

Table 10 provides recent changes for males and females. For males, marginal increases were noticed in non-farm employment such as trading, hotels and restaurant, construction and transport. Manufacturing sector's share increased only a little over this period from 3.2 percent to 3.9 percent. In the case of females, the raise was mainly in Manufacturing and services

Employment in the districts – diversity and the non farm sector

To undertake a regional or district wise assessment we get rich data on employment from the recently released employment figures from the Census of 2001. The 2001 Census has shown

Table 9: Percentage Distribution of Workers by Industry at One Digit Level in Madhya Pradesh, 1983 to 1999/2000

that overall in the state there was a worker participation rate of 42.7. The important indicators assessing both the sustainability of employment and its strengths are the number of agriculture labourers in the total workforce and the share of non-agriculture activities in total workforce, and we can see this data in Table EL 5 late in this report.

The number of agriculture workers can be used as an excellent proxy for finding the level of precarious or unstable livelihoods, as these workers form the most vulnerable and

Table 10: Distribution of Workers by Industry at One Digit Level: Males and Females (%)

Source: NSS Rounds

perhaps low earning of all. The diversification of employment on the other hand shows strengths in employment, it is generally an indication of prosperity, and usually pull factors arising out of agriculture prosperity lead to diversification in rural areas.

Overall in the state, there are 28.7 percent workers engaged as agricultural labourers. The districts with a very high share of agriculture labourers are Narsimhapur, Seoni, Mandla and Harda, all above forty percent. Nearly forty percent of the agriculture labourers of the state are concentrated in eleven districts of Rewa, East Nimar (Khandwa), Balaghat, Chhindawara, West Nimar (Kargone), Dhar, Sidhi, Shahdol, Seoni, Satna, Betul, and Sagar. Most of the districts come from the poorer south central part of the state, characterised by heavily forested area and large tribal population. There are also districts of Nimar, and the two on the north eastern part of the state, Rewa and Satna.

Districts with a low concentration of labourers in agriculture are (we do not consider districts with large urban concentration such as Indore, Bhopal, and Gwalior), Morena, Jhabua, Datia, Tikamgarh, Shivpuri, Bhind and Chhattarpur. These districts form the Bundelkhand belt of the state along with some districts from the Chambal/ Giridh belt.

Looking at diversity in employment, from the 2001 Census we get information on share of non-agricultural workers and workers engaged in household industries. We will not look at Bhopal, Indore, Jabalpur and Gwalior due to the high concentration of urban population and large cities in these districts. Sagar and Damoh have a very high number of non agriculture workers – 48 and 42 percent respectively, but

almost half of these belong to household industries, which would mostly be bidi rollers. Bidi rolling extends in large measure to Katni, Jabalpur, and Satna. The districts apart from Sagar and Damoh with a significant non-agriculture workforce (at least 25 percent) are Katni, Hoshangabad, Satna, Ujjain, Morena, Raisen, Bhind, Shahdol, Chhindwara, Vidisha, Ratlam and Chhatarpur. There is no significant regional pattern, but many of these districts have good agriculture.

A few significant zones do appear in terms of diversifying livelihoods, and these would be the belts of Sagar/Damoh/ Katni/ Jabalpur in central Madhya Pradesh, Gwalior/Bhind/ Morena in the north, Ratlam/ Ujjain/ Indore in the western Malwa plateau, and the Hoshangabad/ Bhopal belt in the west centre of the state. All these zones have their own characteristics, but the common elements are that they have zones of agriculture prosperity, proximity to a large urban conglomeration and some industrial or industrial service based activity in them. They are also interestingly associated with specific crops or types of produce, such as Mustard associated with Bhind and Morena, and soyabean associated with Ujjain with Ratlam also falling in the soyabean producing zone.

On the lower side of employment diversification fall Dindori, Jhabua, Mandla and Barwani (15 percent non agriculture workers or less). Sixteen districts in all have non agriculture employment less than twenty percent. Such a low diverse base for employment is a worrying situation especially for districts where agriculture potential is low.

Unemployment

Estimates from unemployment come from National Sample

Surveys. These are based on assessment of people in the labour force, i.e. they are either working or are looking for work or are not working for reasons other than not getting work (such as illness, holiday, festival etc.) and those amongst them who have not got employment. Unemployment rate is the ratio of unemployed to labour force. Similar to work participation rates, NSS provides unemployment rates by usual status, current weekly status and current daily status.

Usual Status: The unemployment rates are relatively high in urban areas than rural areas in Madhya Pradesh (Table 11). Unemployment rates among males are higher than females in rural and urban areas, except in the drought years of 1987-88, when males must have found it more difficult to get employment as agriculture and allied sector would have dried up substantially. The unemployment rates by usual status for males indicate no growth in unemployment since 1987/88, in both rural and urban Madhya Pradesh. For females there has been a gradual decline in unemployment rates over the same period.

Current Daily Status: As can be seen from Table 11, the unemployment rates according to CDS are higher than those of usual status. Except for females in urban Madhya Pradesh, the unemployment rates of males and females went up considerably between 1987/88 to 1999/2000.

Underemployment

Underemployment is commonly defined as the underutilisation of labour time of the workers. Some of the workers classified as usually employed do not have work throughout

Table 11: Usual Status and Current Daily Status Unemployment Rates in M.P. and India

	Usual Status				Daily Status			
	M.P.		India		M.P.		India

Unemployed	18	32	17	24
Not in labour force	56	52	311	273
Total	1000	1001	1000	1000

Source: NSS Rounds

the year due to seasonality in work or otherwise and their labour time is not fully utilised – they are therefore underemployed.

The unemployed person days for rural males in Madhya Pradesh has increased from 1.8 percent in 1993-94 to 3.2 percent in 1999-00 (Table 12). Similarly it increased for rural females. For the females, the percentage of employed increased significantly while that of 'not in the labour force' declined during the period 1993-94 and 1999-2000.

However, when we see the data given above, we will see that un-employment rates are particularly low, and that the figures for un-employment somehow do not ably justify or explain the high levels of poverty persisting, whether in Madhya Pradesh or in the entire nation. Further, field studies and the general condition of poor indicates that the poor in India cannot afford to remain without work for any period of time, whatever be the remuneration they receive for their work. With low illiteracy and education, the poor do not have any qualms or constraint in taking up any kind of work. Not just these, with hardly any reserves of cash or kind, residents of poor households cannot afford to sit a home. Unemployment and employment figures do not adequately cover under employment or low wages and un-sustainable livelihoods.

Apart from basic un-employment there is large scale under – utilisation of workforce that figures presented in the tables hide. Most agriculture labourers remain idle for 3-4 months in a year. Outside the agriculture season, many casual labourers get work up to two thirds of the days at the maximum.

Quality of Employment

Focusing on employment and unemployment fails to capture an aspect of the employment problem, which is extremely important, and this relates to what may be called the quality of employment. Income or wages is one of the variables reflecting quality. Many people are employed but they get low wages and income. That is why there is so much gap between unemployment (based on time criterion) and poverty and we have

Table 13: Distribution of Usually Employed by Category of Employment

Year	Rural M. P.			Rural All India		
	Self Employed	Regular Employed	Casual Labourers	Self Employed	Regular Employed	Casual Labourers
1987-88	64.9	7.3	27.8	59.4	7.7	32.9

Source: NSS Rounds

many numbers of 'working poor'. In this section, we examine changes in variables representing quality of employment such as casualisation, labour productivity, real wages and, poverty by sectors.

Casualisation of Labour: The proportion of self-employment has been declining over time (Table 13). One of the reasons is the decline in farmers cultivating their own land owing to fragmentation of holdings. There has been sharp increase in casual labour, to the extent of 12 percent as a percentage of all workers. In recent years, the percentage of casual labourers has become marginally more than the same for all India. As shown in Table 14, the percentage of casual labour increased for both males and females.

Labour Productivity

Gross state domestic product (GSDP) at constant prices per NSS worker – provides one meaningful absolute measure of employment quality. As per NSS, worker productivity of Madhya Pradesh and India is provided in Table 15. Labour productivity in agriculture remained more or less stagnant between 1983 and 1993/94, before rising somewhat in 1999-2000. In construction there was a significant decline over this period, especially in 1999-2000. On the other hand, manufacturing sector recorded significant increase continuously since 1983 – and more than doubling to 1999-2000. Transport was another sector where per worker productivity rose to twice its value between 1983 and 1999-2000.

Table 15: Labour Productivity (GSDP per UPSS worker) in Different Sectors (Rs. At Constant 1980-81 Prices) in M.P. and All India

Year	M. P. (GSDP per person)

1993-94	2870.87	9139.12	12326.58	10800.23	11468.26	9678.27

Source: For Madhya Pradesh calculated by MPHDR Team from NSS (Various Volumes) and Economic Survey Government of Madhya Pradesh (Various Volumes) and Figures for India from Bhalla (2000), Bhalla (2001)

A comparison with All India upto 1993-94 shows that the levels of labour productivity in Madhya Pradesh in Agriculture, Construction, and Services were higher for all India. The near stagnant or declining per worker output in agriculture and construction points to the crisis of productivity and the urgent need to take people out of these sectors into manufacturing, transport, services, and even trading activities.

A more recent estimate on per worker output or worker productivity and per annum of growth rates of productivity are given in Tables 16a and 16b below (based on GDP at constant 1993/94 prices). These estimates show that manufacturing and services recorded the best per

annum increase. On the other hand agriculture was in fact in the negative.

Real Wages

Trend in real wages is an important indicator of changes in livelihoods. Table 17 indicates that real wages increased in the later half of the 1980s, but growth rate was very low in the 1990s. The trend rate of growth for males declined from 4.55% in the 1980s to 0.071% in the 1990s. If we look at the real wages numbers in this decade, wages have stagnated. Growing rural wages in real terms was one of the key determinants of poverty reduction in India in the 1980s. The trend in wages in last decade is therefore worrying. It is also not clear

why the increase in real wages are not commensurate with that of labour productivity.

The non-agricultural worker productivity and output per worker is higher than those for agriculture. It indicates that diversification to non-agriculture may be due to pull factor rather than push factor.

STRATEGIC OPTIONS

Challenge

The above facts on macro scenario shows that the immediate challenge is to diversify the activities which include shifting the workers to non-agriculture sector to improve the livelihoods of poor workers. It may be noted that agricultural growth would not be sufficient to absorb the growing labour force. As shown above, In India as well as in Madhya Pradesh, unemployment rates are not high. The rates are around three to five per cent in MP. This is because unemployment rates are based on time criterion. Poor people are too poor to be unemployed for a long time. We have the concept of "working poor". In other words many people are working at low wages, low working conditions in agriculture and informal sector. Therefore, the challenge is to shift these workers to high productivity sectors and also create new jobs in the non-agriculture sector. Thus, the real nature of the unemployment problem is not that people are not 'employed' in some activity but that large number of those classified as employed are engaged in low quality employment, which does not provide adequate income to keep a family above the poverty line. Besides, the employment

opportunities available in the market too often do not come up to expectations of the new and increasingly educated entrants to the labour force. The employment strategy we need therefore is not a strategy, which ensures an adequate growth in the volume of employment but one, which ensures a sufficient growth in high quality of employment opportunities.

Around 94 per cent of the Madhya Pradesh workers are in the unorganised sector. Therefore policies have to take into account the unorganised sector. The options will also have to deal with equity and reduce the gap between per worker outputs, and wages amongst different sectors and ensure that sectors employing larger numbers provide better incomes.

Projections and Strategic Options³

In order to have macro strategies, we need to know the likely scenario of employment, investments needed in future. Therefore, we have made projections in Table 18 for the workers and investments in the five-year period and 20 year period. Also, five scenarios of projections were made in order to know the impact of investments in different sectors on poverty and inequality. The procedure followed for projections are the following.

- Using employment data of Census 1981 and 1991 for 10 NIC (National Industrial Classification) categories (one digit level) and State Domestic Product (SDP) data, we computed the Compound Annual Growth Rate (CAGR) of output per worker
- Based on this, we projected employment and output in each category for 2005 to 2020
- The employment and output along with the Incremental Capital Output Ratio (ICOR) was used to estimate the investments needed and the CAGR of SDP for 2005 to 2020

The following assumptions were made regarding ICOR

- In general, productivity enhancement has been assumed to be coincidental with increase in ICOR
- Accordingly, ICORs have been increased where they were low
- However, ICORs have been reduced where efficiency gains are likely to set in due to private ownership, competition etc.

The projections show that employment would increase from 29.6 million in 2001 to 44 million in 2020 i.e. by 14 millions. If we add the 3.7 million backlog of unemployed and

Table 18: Projections of Workforce (in millions) in Madhya Pradesh

Workforce (in millions)		24.3	29.6	33.1	36.1	39.9	44.0	

³ This sub-section is based on Mahendra Dev and Mahajan (2000)

severely under employed in 2000, labour force increase by 2020 would be 18 million. These numbers in a sense sum up the employment problem for the state in the coming decades.

Apart from the workforce numbers, we also need to consider the Incremental Capital Output Ratio in the state in this decade for our projections and evolving strategic options (see Table 19a and 19b).

Employment Strategies: Five Options

Next question is to examine the strategic options, which would give an idea of the likely impact on employment, poverty and inequality. Projections have been made for ten major economic sectors covering agriculture, manufacturing and services, for Growth in Output (Value Added), Livelihoods (Employment) and the impact on income disparity (between agricultural workers and average worker). It has been assumed that in the selected sectors, investment will also lead to increase in productivity and reduction in Incremental Capital Output Ratio. The projections of impact of investments on employment, workforce productivity, income disparities between agriculture wages and other wages would ensure that strategic choices lead to best input to output ratio for investments to employment, meanwhile ensuring sustainable livelihoods and better equity.

Growth requires investments, and to build projections, investment scenarios have been worked out. Projections were made for investments in Natural Resources or NR (Land, water, forests, and livestock), in Infrastructure or IF (power, roads, warehouses, market yards, telecom etc.), Human Resource development services or HR (nutrition, health, education, vocational training), and Institutional Development services or ID (financial services, public administration, law

and order, local government). Total investment were worked out in the range of Rs 10,000 crore per year (10-15% more than 2000-01 estimates).

The following are the four options discussed.

- **Status Quo:** No change from 1981-91 trends and this is termed as Base in the tables below.
- **Agriculture, and allied (NR) and services (HR)** sectors productivity has been enhanced, as also employment in the latter two sectors. Here also we are assuming that there is no increase in agricultural employment.
- **Infrastructure Services (IF) and Institutional development (ID)**, where infrastructure includes Electricity, Gas and Water and Transport and Communications and Institutional Development includes Financial and Business services.
- **Agriculture, and allied, services, Infrastructure services and Institutional development**, where in the service sectors productivity and employment has been significantly enhanced

In these five options we make assumptions on investments, and corresponding growth rates in incomes, employment, sector change in employment etc.

Findings

Our estimates of the key indicators of different strategic options for employment generation are presented in the table below.

The results of projections and their impact based on the investments mentioned in Table 20 are shown in Table 21.

The projections have been made up to the year 2020. The detailed results of these investments are presented in earlier tables. The best scenario is enhanced investment in NR+HR. This will lead to highest employment, with moderate GSDP

growth and least income disparity. Investments in Agriculture and allied and Services option seems to be the most desirable from the point of view of increasing employment, while reducing poverty and income disparity significantly

The second best scenario is enhanced investment in NR+HR+IF+ID. This leads to High employment with highest GSDP growth and moderate income disparity. This option including all sectors is better in terms of employment created, but requires more investment and does not reduce income

disparity as much

The scenario of enhanced investment in IF+ID will lead to moderate employment generation, with moderate GSDP growth and higher income disparity. The result of investment in industry generates lowest employment, with highest GSDP growth and highest income disparity.

Putting the strategic options in a box, the matrix in Table 21 exhibits the projected positive impact on different groups by investing in different sectors.

CONSTRAINTS, POLICIES AND RECOMMENDATIONS

In this previous section we have discussed that public sector cannot generate jobs and the future employment has to be created in organised and unorganised private sector. Government should act as a facilitator to increase private sector investment, which in turn increases employment. In this section, we will discuss about constraints for private sector participation and suggest recommendations for promotion of employment in different sectors of Madhya Pradesh.

Livelihoods in Madhya Pradesh are very largely dependant on agriculture, or are forest based or lie in the urban un-organised sector. It must also be mentioned here that livelihoods, or livelihood sectors no longer exist purely in primarily rural and urban divisions, but extend from the one to the other. There is no strict rural or urban livelihood region or sector.

Within the wide range of livelihoods, there are those that exist at subsistence levels. The vulnerable groups amongst those employed are the landless labourers, and the marginal farmers, the tribals, the urban unskilled labourer, and women,

both in the rural and in the urban areas.

Trends show that as a rounded figure, approximately ten lakh persons would be entering the workforce every year over the next two decades. The challenge for livelihoods promotion over the next twenty years is to ensure productive livelihoods for this number, as also for the existing 25 million workers and the five million unemployed. This requires a job-led growth of the economy, which in turn needs a specific investment pattern in different sectors.

Changes are required in the pattern of livelihoods in the state. Livelihoods need to be moved from primary sector to secondary and tertiary sectors. The change in employment pattern needs to be substantial enough to reduce workforce in agriculture from over 80% to 40% by 2020. So a large number of workforce would need to move out of agriculture to Manufacturing, Construction and Infrastructure, but primarily and substantially to Services. Not just this, even within agriculture, diversification is needed, from crop cultivation to horticulture, dairy, poultry, fishery and forest-based, and

already there are trends towards this. Further, there is an urgent need to increase productivity and wages.

This kind of change will require policy and institutional changes, and re-focussing and re-prioritising of investments and programme specifics.

Market Failure and Other Constraints

Market failure and other constraints prevent active private sector participation in promising sub-sectors. This in turn has a negative impact on employment. The direct control of and access to natural resources such as land, water and forests, as well on infrastructure such as power and roads, by the Government has restricted action by private sector and civil society institutions. Some examples of market failure and other constraints are given below.

Labour Market Failure: A large amount of seasonal unemployment in south central and south eastern districts co-exists with shortage of agricultural labour in the Malwa districts and in urban manual activities. The abundance of labour in Mandla migrates to depress agriculture wages even during peak demand season in agriculturally prosperous Narsinghpur, whereas in northern Malwa, competition from neighbouring districts and Kota in Rajasthan keeps agriculture wages comparatively higher all through the year.

The “shortage” of adequate labour, which is to say labour with required training or experience is also missing in many sectors. In some place this has also led to construction contractors to go in for mechanical equipment for digging, earth-work, road laying, and so on. The problem is even more severe when one moves up slightly the skill ladder, such as for carpenters, masons, plumbers and electricians.

There is an absence of mechanisms for moving workers out of sub-sectors where demand is declining, such as bidi rolling or handlooms, into those sub-sectors where demand is increasing, such as construction, repairs and small engineering. This failure in the labour market can partly be explained by the lack of information, inadequate rural-urban transportation linkages and inadequate difference in wage rates to compensate for the risk of migration.

Natural Resource Regime: The forest laws and management regime has kept people away from forests. This regime is in place although the economic exploitation of forests, both wood and non-wood produce, is directly based on people, especially those who traditionally and today work in forests and survive very substantially on forest, both as consumers of forest produce and as collectors of forest produce and workers in forests. The forest laws have kept people away from any direct control or any form of ownership or community

partnership in preservation and sustainable exploitation of the vast wealth of the forests of Madhya Pradesh. The conflicting interface between forest dependent population and the forest laws has had negative impact on livelihoods of a very large number of people in the state.

In the last decade there has been considerable work in involving people in managing forests through the joint forest management programme, and innovative strategies through the Lok Vaniki Programme, and efforts to promote bamboo cultivation etc.

Credit Market Failure: There is a huge unmet demand for credit. As per the State focus Paper of NABARD, the potential plans prepared by NABARD for the undivided Madhya Pradesh was estimated to be Rs 19,969 crores for the period 1997/98 to 2001/02, compared to Rs 6,978/- actually disbursed. The actual “ground level credit flow” according to NABARD for the new Madhya Pradesh during 1999/2000 was only 75 percent of what has been estimated as potential in rural MP. At the same time, there is no constraint of funds, as is obvious from the Credit deposit ratio of the state at 57.8 percent in March 2000⁴. In fact the credit deposit ratio in Madhya Pradesh has been declining over the years. The average credit per hectare of area cropped in Madhya Pradesh for the year 1999/2000 was just below Rs 560/-. This shows the fairly low agriculture credit dispersed in the state. There is a huge network of banks, even in rural areas, with 2842 rural branches. There are even targets and priority sector lending obligations.

Yet, the availability of credit, both for fixed asset purchases and for working capital, have been a problem area both in terms of access and transaction costs. Due to the inadequacy of loan amount, time delay and excessive paper work in getting a loan from formal institutions, a majority of the producers rely on informal channels, such as traders for working capital. The SHG movement in the state testifies the extent to which the poor face credit constraints and the extent to which they are willing to invest their time in having access to flexible and friendly credit sources.

Apart from credit market failure, the newer rural sub-sectors fail to attract private investment as the private sector seeks opportunities with an assured return considerably higher than the bank interest rates. If the return is higher but perceived risk is also higher, then private sector hesitates from investing. Thus an attempt needs to be made to reduce risk perception through information sharing and appropriate regulatory frameworks. For example, investments in the forestry sector will not come as long as restrictions on felling and transport of timber are not rationalised.

Commodity/Product Market Failure: Lack of information

4. Lower credit-deposit ratio indicates not necessarily 'surplus' but utilisation of funds elsewhere. In general, credit-deposit ratio for rural areas in the country is lower than for urban areas indicating that rural areas are net savers whereas urban areas are net investors.

about new market opportunities has restricted the participation of the private sector or constrained micro-entrepreneurs to continue catering to declining market segments. The example of soybean illustrates this the most. While there is a competitive squeeze in the edible oil market due to cheap palm oil imports, the market for protein focussed soybean product markets has remained untapped. No one has responded to this. This is due to lack of information on new market segments.

Similarly while there is a large market, especially export market, for the *durram* variety of wheat variety grown in Madhya Pradesh (due to high protein content), no marketing arrangements have come about to take advantage of specific demand for this type of wheat.

Generally the role of middlemen in marketing is criticised as they siphon off a major share of the value added. However, the positive role of “middlemen” has to be recognised in marketing products that are produced by the unorganised sector. It includes their role in identifying the market demand pattern, transportation and taking risk of the product damage and price changes in between transporting it from the producer to market. In several cases, members of Self Help Groups find it difficult to market their products. They could actually benefit by dealing with competitive middlemen. The move by State Government to bring in private sector involvement in selling produce of self-help groups indicates a change in the marketing arrangements and could pave the way for an effective marketing intervention.

Infrastructure Constraints: In terms of infrastructure, the state of Madhya Pradesh has been lagging far behind. The index of social and economic infrastructure constructed by the report of the Eleventh Finance Commission places Madhya Pradesh at eighteen out of twenty five states in the country.

Two sectors where the state has had problems are roads and power. The states power situation has suffered due to the bifurcation of the state, with many of the power units going off to Chhattisgarh. Lack of power in rural areas is a constraint for agriculture as well as some of the rural non-farm sub sectors. Any of the medium sized non-farm units require electricity, such as small lathe machines, small wood units, large pottery units, handloom weavers so that they can weave late in the night using electric light. Power is also necessary for any unit expanding from a household enterprise to employing 4-5 people or attempting to increase productivity. Lack of adequate and sustained power has also affected agriculture operations in the last two years due to drought conditions in the state. The recent reforms in the state, charging power supply to rural areas, attempts to streamline distribution and enhance production would certainly reduce uncertainties and shortfalls in power within the next year or two at the maximum.

The road network of Madhya Pradesh is also not up to the mark. The large land mass coupled with low population density makes it difficult to get good road connectivity. This problem is compounded by the large black cotton soil area where maintenance and upkeep of roads is a challenge, and the undulating and hilly terrains where new roads and their maintenance are difficult and expensive. Recent efforts where private sector has already been partnered in about a dozen major roads in the state for construction and maintenance, the efforts in rural connectivity through the state governments own efforts from mandi cess levied for better rural transport should help the rural road connectivity in the state. This will be further assisted by the roads being built under the Prime Ministers Gram Sadak Yojana. Road connectivity has very direct benefits such as marketability, push to the transport and rural tourism sectors, local horticulture production, etc.

The telecommunication network in the state has also been lagging far behind national achievements. However the last few years have changed the situation in Madhya Pradesh. The public sector provider BSNL along with private sector telecom providers have given the state a very good networked system, and the state can not only boast of being the first state to have private telephony, but also the largest fibre optic network in India.

The lack of training and infrastructure is also felt in almost all sectors, especially in rural non-farm sub sectors. There are funds and provisions available for these under various schemes, and the state government has been utilising the funds so available (eg. all funds for training in SGSY are being fully utilised), there is need for more participation. Training cannot be handled by government alone and private sector involvement is essential.

Policy Suggestions and Recommendations

The Government has to act as a facilitator and create favourable conditions for private sector participation and identify and prioritise key sectors with employment potential and ensure successful implementation. The state has already ventured on three sets of initiatives in the state directed at promoting livelihoods. One initiative is the set of strategies employed at creating conditions for increasing productivity of assets and enhancing the productive potential of people and their productive assets, such as the watershed mission and Joint Forest management. The other initiative has been two major programmes, one the Indira Gandhi Garibi Hatao Pariyojana that covers fourteen of the states poorest districts, and another that is on the anvil is Rural Livelihoods Project in seventeen districts. Both these programmes together could provide a platform for sustained and co-ordinated action on livelihoods.

The third set of initiatives is in the realm of policy and legal framework for livelihoods. The state has embarked upon bringing in changes in the land and natural resource (especially

water) management and use regime through a proposed legislation that attempts to ensure equity in the use and exploitation of such resources. Simultaneously there is also an attempt through advocacy to change certain provisions of national forest acts to give greater community control and participation in managing and using forests. These legal efforts will undoubtedly have a substantial impact on peoples' livelihoods. Related with the legal framework, are efforts at the policy level.

The state government has just released the Economic Development Policy of the State, which takes a look at and covers the entire spectrum of economic activities from agriculture to manufacturing, from energy to roads, from social sector development to bio-technology. It provides a comprehensive picture of where the state would like to go, and also comments on what should be the nature and thrust of private – public partnership, and the role of state and its supporting agencies.

Towards promoting livelihoods, the involvement of the state government, and through its direct and indirect incentives, private institutions and private organisations also have to play their part.

- The role of the government should be to mainly invest in natural resource development (land, water, livestock, forests)
- human development (nutrition, health, education, vocational training)

- Government should attract investment in but not directly invest in infrastructure, industry, construction and trade sectors.

A major responsibility of the government will also be to improve productivity of capital through institutional development services. The investments of government both financial and institutional building on such services as law and order, loan recoveries (strengthening Debt Recovery Tribunals), contract enforcement, regulation of markets etc. These will have a signal impact on investments.

In micro strategies, the issue is of where should investment be attracted and undertaken. Some important principles to be kept in mind are will not to spread everywhere, but select and invest in clusters. Small towns are important engines of rural growth – so there infrastructure, and markets are important. There should focus on one or two small towns other than the district Head quarter in each district, making up around 100 growth clusters for Madhya Pradesh.

Based on the strengths of different employment sub-sectors, and current trends hundred growth engines have been identified for Madhya Pradesh. There are thirty in Natural resources, thirty in rural and urban small industries, twenty in rural and urban small Infrastructure, and twenty in rural and urban Services. The reasons for selecting a large number are to ensure full-employment and ensure regional

Government Led Promotion of the Soyabean Sector

The promotion experience of soyabean in Madhya Pradesh is one of the major success stories of government led promotion. The soybean sector changed the lives of more than 30 lakh farmers, who shifted from *Kharif* fallow, Minor Millets and Cotton to Soybean Cultivation. But the impact was not just on farmers, but it also affected 40 lakh farm labourer, about 50 thousand are involved in loading-unloading, 10 thousand involved in transportation, 6 thousand involved in 60 odd processing units, and many more in related and support industries, such as production and distribution of Seed, Rhizobium, Fertiliser, Gunnybags, Transport Support, and Dhabas.

What went into making this happen? This was a concerted co-ordinated programme launched through the National Oilseeds Development Programme following the commitment of Government of India to become self-sufficient in edible oils. There was focussed research of oilseeds, and simultaneously in Madhya Pradesh the Tawa dam project went into action, bringing large areas under perennial and assured irrigation.

The state played its role and

- Established a Co-operative Network
- Created Processing Facilities
- Created Warehousing Facilities
- Ensured that No Barriers were Imposed on movement of goods

What went wrong:

- Failed to enter the human grade protein market effectively.
- Could not compete with Oil from Malaysia

- Productivity stagnated around a Tonne-a-Hectare
What could be the way ahead:
- Enhance productivity of soybean
- Farmer is looking for a return per acre of land and not return per tonne
- Even if we can push productivity to about half of world average production, return for farmers would double
- But the market may induce shrinkage in area under soybean
What do we have:
- We have the agro-climatic condition: soil, rainfall, temperature, sunshine
- We have infrastructure facilities to serve such a large area base
- We have 30 lakh farmers in commercial cultivation
- We have a forward looking state administration looking for solutions
Possibly we can look at:
- Organic cultivation of crops, such as cotton, as
 - There is experience of cotton cultivation
 - Agro-climatically suitable
 - With rejection of synthetic fabric, cotton is coming back
 - MP conditions are suitable for eco-friendly production: Maikal Experience
- Look for other similar commodity subsectors where we have a competitive advantage

coverage. The 100 growth engines and 100 growth clusters give a livelihood promotion strategy. It is a “guide to action” for development agencies. In practice, any district would have 3-5 growth engines and each engine would be spread over 5-7 districts.

A list of the possible growth engines for Madhya Pradesh are listed below.

Natural Resource Based Growth Engines

- For the landless and marginal farmers - concentrate on Soyabean and Mustard, Cotton, Wheat and Paddy, Pulses and Jowar, Fruits and Vegetables, Spices, cultivated medicinal and aromatic plants, and repair of agro equipment such as tractors, sprayers, and pumpsets.
- For tribals — natural resource based opportunities lie in NTFPs (tendu, mahua, amla, harra), gathered medicinal and aromatic plants, bamboo and grasses, timber (CP Teak and others), eco-tourism based livelihoods, and natural resource based handicrafts (wood, bamboo, metal).

A list of the possible Human resource development based growth engines would be -

- For the landless and marginal farmers - primary and elementary education, and vocational skills
- For tribals, this would mean investing in natural resource conservation skills and eco-tourism guides
- For women, it will require investing in agricultural skills and livestock rearing skills

The possible growth engines for urban and unskilled would be in repairs and recycling services. These options also mean investing in conserving capital, the environment and generating jobs for the poor.

- In Repairs, the potential lie in repairs of vehicles (which are growing at geometric rates). electrical equipment, electronic goods, and buildings
- Recycling of organic solid waste, paper, cloth, glass, metals, and linking these with. Power generation possible. The promotion efforts for livelihoods would require specific and focussed intervention. These will involve -
- Selection of those growth engines for focused intervention which affect thousands of people e.g. soyabean, dairy, NTFP, power.
- Get professional agencies to draw up plans and implement. This does not call for report writing, but agencies involved in livelihood promotion and action.
- Select clusters for pilot intervention in each growth engine
- Appoint agencies in-charge and empower them, monitor them, incentivise them
- Review every six months and scale up to more locations and more growth engines

Livelihood promotion is a complex task, and needs “collaborative polygons”. It means that different types of agencies, people and action is required. The State Government has to be a leader in this field, but not the sole or dominant agency.

The role of the State Government is to ensure participation by all concerned organisations and people, and see to it that required initiatives are in place. Government must get into public-private partnerships – with corporate sector and private trade for the market side and NGOs for social mobilisation.

Selected Growth Engines

The growth sectors that should be focused for selected promotion are listed below. The selection of these growth engines is based on their current strength, potential and expected growth track based on trends.

The selection of which growth engine or sector to select and promote must be undertaken regionally and district wise, depending on local field realities.

CONCLUSIONS

In conclusion we examine the employment situation in Madhya Pradesh by providing a profile of trends in employment and unemployment including quality of employment. The paper also discusses about constraints and provides policy suggestions and recommendations for promoting productive employment.

The nature of employment problem in Madhya Pradesh can be summarised as follows.

- Employment in Madhya Pradesh is largely unorganised, rural and non-industrial. The work participation rates declined significantly in both rural and urban areas in the 1990s.
- The employment growth recorded a drastic decline during 1993-94 to 1999-2000 as compared to those for the period 1983-84 to 1993-94. Probably the expectations of increasing employment opportunities due to economic reforms has not materialised at the aggregate level.
- There has been a proliferation of small and marginal farmers over time. The share of cultivators in the total declined while those of agricultural labourers increased.
- Only around 6 per cent of the total work force is in the organised sector in Madhya Pradesh. The growth of employment in the organised sector has declined over time. In the post-reform period, the growth of public sector employment declined drastically while that of private sector employment increased. However, the growth of private sector employment has not been able to compensate for the loss of jobs in the public sector.
- The share of non-farm employment in rural areas has been stagnant since 1983. There has been some variation over the years, but the rural non-farm share has become more or less constant. According to census 1991 estimates, Madhya Pradesh had the lowest share of rural non-farm employment to total rural employment
- There is no sign of increase in the usual status unemployment rates. However, the daily status unemployment

Natural Resource

- Watershed development – to enhance productivity and stabilise incomes of dryland farmers : soya, mustard, arhar, chana, jowar,
- Irrigated crops – wheat, cotton, sugarcane, paddy – to increase productivity and quality for local processing and export marketing
- Horticulture development – citrus, peas, potato, vegetables, flowers, cultivable aromatics
- Joint forest management – tendu, mahua, amla, myrobalans, other NTFPs, bamboo, timber
- Livestock rearing – dairy, poultry, sheep/goat
- Fishery, sericulture
- Minor minerals – stone, sand, limestone

Rural and Small Infrastructure

- Power - decentralised generation, biomass
- Power - local power distribution franchises
- Irrigation : tanks, canals, borewells
- Water - drinking water franchises
- Roads - construction and repairs, toll collection
- Road transport terminals; container depots
- Warehouses and Cold storages
- Plant nurseries; tissue culture units
- Market yards (mandis) and Haats
- Telecom - including voice and Internet

Rural and Small Industries

- Agro-processing: wheat, soyabean, mustard, paddy, pulses, cotton, spices, vegetables
- Crop inputs: bio fertilisers, bio-pesticides
- Livestock based processing: dairy, poultry, fish, leather, meat
- Timber and NTFP: aromatics, medicinal plants, bamboo, tendu (bidi), mahua, amla processing
- Stone processing, cement building materials
- Textiles: handloom (niche products), powerloom, apparel (low and high end)
- Metal, glass, ceramic and plastic products

Services

- Wholesale trading
- Retailing - marketing agencies
- Health care
- Veterinary care
- Education all levels
- Vocational training
- Rural tourism: Hotels and restaurants
- Entertainment services
- Micro-finance – thrift, credit, insurance
- Business and real estate services

Urban Unskilled Services

- Transport of passengers and goods
- Repairs – vehicles, electrical equipment, electronic goods, buildings
- Recycling – solid waste, paper, cloth, glass, metals.
- Retailing (hawking) - food items, vegetables, cloth, other consumables
- Household services - domestic help, child care, old-age care, house-keeping services, catering
- Security services, plumbing/electrical repairs, office services

recorded significant increase in the 1990s. It is a matter of concern for the state. The problem of unemployment is more with the educated and youth.

- Casualisation has been increasing over time.
- Labour productivity showed high growth in agriculture and manufacturing in the 1990s. In spite of this, the growth of real wages in rural areas declined significantly in the 1990s.

Our macro projections show that focus on agriculture & allied and services option seems to be the most desirable from the point of view of increasing employment, while reducing poverty and income disparity significantly.

We have discussed about the constraints for private sector participation. Market failure in labour, credit, product are some of the constraints. Low infrastructure is another important constraint.

The study recommends that given the problem of unemployment and underemployment for the masses and unemployment for educated, *there is a need to have twin strategies for improving the livelihoods*. The first sub-strategy should aim at rural and urban masses who are illiterate/semi-literate, unskilled, semi-literate/skilled. The second sub-strategy has to address the educated unemployed. The policy goal should be to improve economic growth in rural areas with emphasis on employment for the poor, and shift workers from agriculture to non-agriculture activities, particularly services in rural areas. To achieve this goal, it is necessary to focus on selected growth engines and clusters as suggested earlier.

In conclusion, we can say that the task of generating employment is an urgent one and needs a range of concerted actions from the government, donors, banks, and the private sector and from civil society institutions.

Human Development: The Institutional Underpinnings

Promoting human development has been an important objective of government policy in Madhya Pradesh in the second half of the 1990s. The first Human Development Report (HDR) in 1995 provided a baseline of information on the status of human development on chosen indicators. The magnitude and spatial dimensions of the problem became much clearer than ever before. The report became the focus of discussion and debate across the state¹. Given, for example, the financial investment that the government had been making in social sector areas like primary education, the question was sharply posed: why was the picture so poor? If, for example, every village had a school, then why were so many children out of school? Why was literacy so low? Going beyond the cynical, “Govt is inefficient” kind of general statement, the HDR was part of the thinking and reporting the government resorted to and raised for itself a whole new set of questions for the policy makers.

The Human Development Report was not just a report prepared in isolation. The state had put its focus on action on human development from 1993, with the Rajiv Gandhi Missions focussing on specific areas of immediate and focussed attention, increased attention to health, and education and taking the path of implementation through decentralisation and empowerment of people through making them vehicles of their own development. The report became a kind of a companion document to this process. The HDR was a part of the overall process of people centred development, part of a commitment to report also on the gaps and achievements in field of human development in the state, and to facilitate a debate on feasible and acceptable solutions.

Clearly, the then existing systems were either inappropriate or inadequate. The focus of policy therefore changed: in addition to allocating [more] finances, the government now began to look into *how* it was implementing its policies. Systems of administration were re-examined. For example, in selected areas of priority, the Rajiv Gandhi Missions were set

up in the Chief Minister’s Office with specific time bound goals but drawing on the existing governmental machinery. This was to enable the Government of Madhya Pradesh to work with a sharp focus.

The second Human Development Report of 1998 took this issue further. It looked into what had been done in the three years between the two reports². And it faced the question of agency³ squarely. *Who* was to implement these programmes? *How* were these policies to be implemented? And the answer was clear: it was through *the mechanism of decentralisation*. The system of local governance brought in by the 73rd and 74th constitutional amendments provided the *instrument* through which the social sector objectives were to be achieved⁴. Elections to local bodies had just been held, and these bodies were mobilised for these tasks by the GoMP. People were now not seen as “targets” to be reached but as partners in the process of achieving agreed upon goals. This was a basic shift in vision.

Each of these policy objectives has been carefully monitored, and independent evaluations speak of major changes—and dramatic improvements that have been made in the last five odd years. Thus *the process of decentralisation is central to the question of human development policies in Madhya Pradesh*. And this process itself has been evolving with experience. The various changes in law saw, in sequence, the move to Zilla Sarkar and then to Gram Swaraj.

The purpose here is to inquire into the institutional aspects of this process. What are the changes? What are their main features? Is there an evolutionary process of change underway, or are these the features of special circumstances that may not sustain? Is there something unique to Madhya Pradesh in this process? There are many issues here that need scrutiny.

The role that institutions have come to play in Madhya Pradesh must be seen in the light of the context in which they are operating on field. Institutions have increased multiplicity in the community – multiplicity in number of people involved

1. The Chief Minister has referred to this first report as a record of “our failures” in a speech to a Conference on Decentralisation held in Bhopal on the 25th of August, 2001.

2. In his Preface to the 1998 report, the Chief Minister wrote “since a state government with responsibilities for action cannot rest with analysis, we feel that such a Report must also report on action”.

3. This point was made by Amartya Sen when he formally released the second human development of Madhya Pradesh in New Delhi.

4. What began as an instrumentality for implementing development programmes grew, over time, in to a belief in its value for deepening democracy.

more directly in their own work and in matters that affect them; multiplicity of institutions which sometimes conflict with each other and sometimes re-inforce each other; multiplicity in the forums and opportunities they provide for leadership; and for people to participate. Another crucial role of institutions has been that they help organise and channelise people's energies and creative and philanthropic urges. For development in the background of the 73rd and the 74th amendments, it needs to be undertaken through people's institutions, and the process and movement towards setting up these institutions has been taken in Madhya Pradesh.

This chapter is organised as follows. Section 2 discusses the idea of institutional change: what do we mean by this? Section 3 then moves on to an identification of elements of institutional change that may be seen as underlying the transformations that have taken place in Madhya Pradesh in the last five odd years. Section 4 then looks at a few of the programmes and institutional changes from the field, to see if the elements identified in Section 3 stand up to field reality. Section 5 is by way of conclusion.

1.1 What is Institutional Change?

It is important, when discussing institutional change, to distinguish between *organisations* and *institutions*. This chapter is not about organisations and organisational development. This point may need some elaboration.

An organisation is an agency, often registered under a law, with specific objectives. It could be a private company. It could be a government department. It could be a not for profit society. It is a legal "person", with resources of people, materials and finances. It has to be managed efficiently to achieve its objectives—be it profit or something else. The objective has to be clearly specified if the organisation is to achieve its goal. Thus, the Department of Education, to provide universal primary education to children below 14 years is an organisation in this sense — as is Bharat Bhawan, a premiere national level agency to work in the field of art and culture. Both have to deploy their resources efficiently to achieve their goals. Needless to say, the appropriate choice of instruments is critical to success.

An institution, on the other hand, is a code of behaviour or a set of behavioural norms, explicit or not, by which groups of people act to achieve their goals. It may or may not be linked to a formal organisation. Examples of institutions are, say, the joint family, the caste system or the Indian Administrative Service. Their roots lie in history and tradition. Each is clear about membership and responsibilities of membership. Each comes with an implicit code of behaviour. Yet, the caste system is not an organisation in the sense the

term has been used in this chapter. The IAS is much more than any individual member of the service, or even the IAS Officers Association: it is an institution with its own norms and expected codes of conduct. The boundaries of an institution may not always be easy to identify. Where, for example, is the line between the IAS and the larger civil service of which it is an important part, to be drawn? Both context and judgement become important in a discussion of institutions and how they change over time.

Marriage is another social institution. As an institution, it is more than any one marriage between a couple—it defines the way in which people in society organise themselves on a religious, social or other basis. It defines the way in which children are brought up—and much more. There can be much we disagree with in such an institution—for example, in recent years, the traditional roles assigned to men and women in marriage are being redefined because of the injustice to women [according to modern norms] in traditional marriage. Within the marriage context, dowry in India could be seen as an undesirable example of an institution that is frowned upon in law—yet it exists. Mere law cannot "abolish" such an institution. Thus, even long lasting institutions may change over time—in unexpected ways too.

This does not mean there are no organisations whose objectives overlap institutional concerns. We are all familiar, for example, with caste associations⁵. But there may be traditions that make people behave in certain ways even when there are no formal organisations for the purpose. There are many people who behave in a fair and just manner even when there is no threat of legal action, or compulsion to honour a promise. It is this behaviour within certain parameters or norms that we refer to as an institution. Our concern will be with institutions in this sense of the term—of codes and norms of behaviour in specific contexts. The context here is human development. And changes in such norms, codes and contexts within this broad area then refer to institutional change.

Where human development is concerned, the first Human Development Report of MP was interpreted as showing that the governmental system was poor in delivering results even when government had "good" priorities. The Government of Madhya Pradesh had invested large amounts in schools and teachers, but in 1995 literacy was abysmal. The *institutional* base of policy implementation then was a bureaucratic one. The Department of Education worked in a certain way: a centralised, hierarchical decision-making and implementation process that has little links with the objects of the educational process and its critical elements: parents, teachers and children. As a result of this insight, the Government of Madhya Pradesh made *institutional* changes through the Rajiv Gandhi Prathmik

5. In many parts of India we still have the traditional jati panchayats that function because people accept their relevance and jurisdiction, even when it has no place in the legal structure. These jati panchayats interact with the legal modern bodies in unexpected ways—for example, in the phenomenon of members who are elected unopposed due to the decisions of such agencies. To ignore the existence and influence of these bodies would be to impair the effectiveness of the new legal panchayats.

Siksha Mission outside of the Department of Education. It was part of a set of such missions.

The results of the first few years of experience were discussed in the second HDR of 1998 in the chapter “The Road Travelled”. The achievement of objectives has changed dramatically as a result⁶ of the institutional changes made by the Government of Madhya Pradesh. It is our intention in this chapter to explore the nature of institutional change behind this transformation.

1.2 Institutional Change in Madhya Pradesh

Perhaps with the benefit of hindsight, it could be said that institutional change in Madhya Pradesh began with clarity of objectives and instruments in the mid 1990s. The *objective* was to improve the components of human development—health, education and the like—in an equitable way in a specified period of time. And the *instrument* for achieving this goal was the combination of new initiatives and ideas in the capital and implementation through the new panchayats and peoples collectives at the local level. There was decentralisation with respect to what existed earlier, but it was a process guided from the top by civil servants acting under the directions of the political executive. The Rajiv Gandhi missions brought in new ideas and insights; the panchayats brought in the energies and experiences of the people. The panchayats and working with people’s collectives brought to the fore people’s demands—and the government responded to that demand, through programmes in panchayats, through using peoples collectives more and more in managing people focussed programmes. The two developed into a valuable partnership that is institutional in nature. *Both, not in themselves, but acting in concert, are crucial to Madhya Pradesh’s subsequent experience.* This process is perhaps the key institutional change that was made.

The setting up of the Rajiv Gandhi Missions in the Chief Minister’s Office provided direction and management of an order not available earlier. This also gave the missions the backing of the highest political authority. While the missions drew on expertise and resources within the government, their flexible structure made it possible to bring in resources and ideas from outside in way government departments could not. Further, missions were not permanent organisations like government departments: they could be shut down when the purpose for which they were set up was achieved—or failure became clear⁷. They were seen as *catalysts* of institutional change⁸.

Panchayat Raj – State Government and its Response

In the early years of the new Panchayat Raj system, there were cases where Sarpanch or Janpad Adhyaksha or Zila Panchayat Adhyaksha belonging to reserved categories or a woman would be removed through a no confidence motion, and for the next six months till the bye elections, the caretaker would represent either the dominant communities or be their representative. To prevent this, state Government changed the Act and provided that the caretaker would also belong to the same category as the person voted out.

The cadre of Panchayat secretary drawn from erstwhile Village Level Workers were not found to be very responsive to the Panchayat members. The State Government then abolished this cadre, and allowed Gram Panchayat to choose their Panchayat Secretary. The Panchayat Secretary became dependent on the Gram Panchayat since they appointed him/ her and could remove them through voting in the panchayat. Government changed this and now the approval of the Gram Sabha is necessary both in appointing and in removing the Panchayat Secretary.

The State Government off late has introduced the Right to Recall to Gram Sabha, which is a first anywhere in India. While there are reports that this provision is being used more with respect to elected representatives from weaker sections and women, this right by itself is almost revolutionary and a measure of a truer democracy. Already there are instances of this right being used, including the case of a City Mayor. This is a case unique to Madhya Pradesh.

The second is the implementation of the provisions of the 73rd and 74th amendments to the Indian Constitution, in the form of a series of state Acts⁹ and elections based on them. This has been a case of making the path by walking—the system was one that constantly looked at experience, making adjustments as and when needed. A centralised, bureaucratic and hardly accountable state government system was being transformed into something else—the vision is of a locally managed system in which people participate, regulate and monitor how agreed upon things are done. In the first years of the new panchatai raj, the State Government dealt quite deftly with the problems that emerged vis-à-vis panchayats, problems of its leadership and problems from the field. The box on Panchayat Raj illustrates with some examples.

There are also critics of these changes and say that there have been too many changes too soon. The other response is

6. There are, understandably, debates about the nature of change, whether it is indeed an improvement, how lasting it is and so on. There are critics on this approach, but all agree that change has occurred.

7. For example, the Rajiv Gandhi Missions on Diarrhoea Control and reducing Iodine Deficiency have been closed since they achieved their targets, while the Mission on Sanitation was closed down, as it was unable to make any headway.

8. Physicists, in speaking of a phase transformation—say the change in the state of water from liquid to solid—point out that the presence of an impurity in the water is a necessary condition for the phase transformation to take place. If institutional change is like a phase transformation, then some such catalyst is essential—and here it was the Rajiv Gandhi Mission. The example should not be stretched to refer to it as an “impurity”!

9. Madhya Pradesh Panchayat Raj and Gram Swaraj Act, 1993; the Madhya Pradesh Zila Yojana Samiti Act, 1995 and the Rules; Orders and Circulars that have been passed to give effect to various provisions of the Act.

that changes are responses to field realities and direct democracy of this kind has been experienced for this first time. Therefore problems are to be expected, changes are necessary and are to be done with speed, since this kind of democracy has too direct a bearing on people not to be acted upon with speed.

The existing administration in the districts was one centred on the District Collector, with development programmes implemented by civil servants through the District Rural Development Agency (DRDA)¹⁰. The new system reduced the role of the collector, and brought in new organisations/ institutions like the Zilla Panchayat, Janpad Panchayat, Gram Panchayat, Zilla Sarkar—and others too. The point of difference was the bringing into being elected bodies¹¹, with reservations for women and lower castes, which began gradually to play a role in the implementation of schemes. Democratic processes were also set in motion at the time.

While this is a major democratic change, it is also true that these bodies began work with a number of handicaps. Many elected had little education, and little exposure to issues and alternatives available. Many, from the backward and scheduled castes, and in particular women, came into the system from a background in which they never have voiced their opinions. Few really knew what the law permitted them to do. In this background, support from above was essential—support to encourage them to face their responsibilities, to get trained in a range of skills—to voice their views and those of their constituents. This could not happen over night. The many evaluations that have shown that, women for example, were dummies for a male relative, fail to interpret this reality in context. Yes, they often are dummies. But today, it is they who are formally in office. Their male relatives have to work through them—and this in itself is a major change. What is important in this social context is to see if the women in these positions learn over time, to see if the support system helps them in their tasks, to see if society around them begins to change as a result.

For many programmes another approach was also adopted, that of peoples committees or groups managing these programmes. Many programmes also initiated and organised user groups/ management groups/ peoples groups to manage and implement programmes – the major examples of this are the Village Forest Committees under the Joint Forest Management programmes, Irrigation User Committees under a progressive legislation that brought irrigation users into irrigation management, etc. Even some of the Rajiv Gandhi Missions were implemented through distinct user groups such as the Watershed Committees. Some of these programmes created committees separate from panchayats, in

which Panchayat leaders were sometimes involved in ex-officio or consultative capacities. The objective was not subverting the panchayats but a platform that would be effective for that particular programme, since these programmes involved a smaller stakeholder network and therefore representation to these committees needed a different group to be represented.

The practice of setting up separate committees for various programmes has had impacts on the institutional front, that have been both negative and positive. There is much merit in the strategy that the more peoples institutions there are, there will be greater participation, and contest in and of public space is good for democracy, good for transparency and nurtures leadership. However, what also happened is that these parallel structures often under mined the power and influence of panchayats, and even led to confusion amongst people. Who is ultimately responsible for development? Legally sanctioned and democratically elected panchayat leadership or not. Many of the committees were even getting funds directly that were far more than the funds handled by panchayats and in some cases their patronage opportunities and scope were more than available to the panchayats. Departments were keen to push their own committees, and the field contest between panchayats and these committees were often remote controlled fights between departments and the panchayats and its parent department.

However with the changes in Panchayat Act under the provisions of Gram Swaraj, and the provision of eight committees under Gram Sabha to oversee most development activities, dropping programme specific committees is being encouraged. The Department of Education has taken a lead in this.

Priorities were set on the basis of feedback and information directly from people. The Rajiv Gandhi Shiksha Mission launched a Lok Sampark Abhiyan, which involved school-teachers, local panchas, and the RG mission people—who were government servants. It was from this that the need for schools in *tolas* was recognised. The basic problem was re-defined as one of access to a school. Based on an analysis of the results, and a fresh appreciation of local needs and requirements, the Education Guarantee Scheme was launched. It re-defined teaching and schooling in a new context. Other initiatives were in the removal of iodine deficiency, and in mobilising local people in regenerating watersheds and improving the local base for providing a minimum level of livelihood. The institutional change here is the co-operative functioning of different bodies compared to unilateral decisions by the education department earlier—this is the behavioural norm that has changed.

10. Although the GOI insists upon the setting up of a DRDA distinct from the Zilla Panchayat, MP has merged the DRDA with the ZP. This was important in demonstrating to the newly elected representatives that they were indeed important in the policy implementation process.

11. This was a concrete implementation of Rajiv Gandhi's conclusion, after a series of consultations, that there could be no responsive administration without elected representation.

Having said this, it must also be recognised that the in process there were mistakes, but there was a willingness to learn from them, and that is important—and it is here that the vision and will of the political executive and the implementation of that vision by the bureaucracy becomes important. In Madhya Pradesh, the political executive had a long-term vision. Getting the civil servants to positively implement this vision has been critical in this process. The Chief Minister has provided the leadership that has given the senior civil servants the space to implement his vision. Officers were carefully selected for specific positions, and given stable tenures, long enough to think ahead and plan. This is not very common in India.

The organisations have to be modified to function in the new decentralised environment—this is a difficult task now slowly being tackled through administrative reforms, privatisation etc. Institutions seen as codes of behaviour have to be put in place, and nurtured till they get embedded in society. The change in modes of behaviour became evident first with the manner in which the Missions were implemented, and then extended into other departments and recently even into the more traditional departments and their concerns. Madhya Pradesh became in early 1990's to be the first state to have a privately built road, it built the largest network of optical fibre cabling in the state, and there has been politically supported action in downsizing government. Today the government is inviting the attention of the private industrial, and financial world towards its roads, infrastructure, and investment opportunities.

This process can be seen in terms of its major components. Decentralisation of administration, to be effective, must include decentralisation of *functions, functionaries and funds*. This Madhya Pradesh did as follows¹². Management concepts have been creatively used—Rajiv Gandhi missions provided strategic direction; panchayats brought in people's demands and local control; the Gram Sampark Abhiyan brought in an innovative monitoring system; the District Planning Committees de-concentrated government and took decision making powers to the district—together the government as re-structured to become more responsive and deliver results in a way the earlier arrangement could not. This complex of changes taken together represents new ways of government behaviour, and is the institutional change that we are talking about.

1.3 Institutions in Madhya Pradesh

Let us take a quick look at the range of institutions that have been initiated by the Government and its action, in various initiatives. There is little data to actually find out the membership and level of involvement, since records do not specify duplicity of members, different members of same family/

household in different committees etc.

The major institution of course is the Panchayat Raj in the villages and the institutionalisation of the gram sabha. Under the Panchayat Raj setup are eight committees looking after issues of development, education, health, infrastructure, social justice and so on. Although reports suggest that most of these committees have not become active, they have created space and opportunities for people. The other institutions are in development programmes — watershed committees, in forestry the forest protection committees and village forest committees, committees to manage irrigation in many villages, and self help groups under many programmes.

The committees have provided undoubtedly a platform for people to organise, build common capacities, channelise and organise creative energies, and gave also helped in reducing decision making processes, and bringing conflict onto resolvable platforms. While the Panchayat Raj Institutions and peoples committees do have the issues of dominant power group control, yet the tools of reservations, the opportunities for the weaker and voiceless to participate has had a direct and effective impact on the element of equity, giving voice to poor and marginal. Committees by themselves cannot transform societies customs and relations, but they certainly are giving spaces, hitherto unavailable or available only after much effort and struggle. The membership and effective roles played across the state by women and members of backward and scheduled caste and tribe communities is a pointer towards this.

There is of course another side to the creation and strengthening of peoples' institutions, the opposition and confrontation with bureaucracies. These agencies are challenging institutions of power and disturbing status quo – both within people and between people and government is giving rise to tensions. The fairly aggressive nature with which the State Government is pushing people and their institutions into roles in development and into roles in direct democracy has to some extent not permitted such opposition and tension to obstruct the changes. Yet, much still needs to be done to orient both the bureaucracy and public representatives on the roles and powers of peoples institutions and to bring a more positive work environment.

1.3.1 Rajiv Gandhi Missions

The objective here is not to understand why these missions were undertaken, but to try and understand what were their institutional needs and why were such structures put together.

To talk of Rajiv Gandhi Missions we need to go back to 1993, when a new government was sworn in after a year of President's rule. At the time when the priorities were established and agenda set for the coming five years, it is inter-

12. It must be noted that this was not a one-off change but a gradual process, with some steps being retraced when experience warranted—and on this there can be much debate.

esting to note that institutional arrangements for achieving some of these goals were also looked into. The government has often stated that there were two choices in front of the state as far as its priorities and path of development were concerned. One drew from the ongoing changes loosely termed as liberalisation in India and the subsequent integration of national economy into global systems. The other path was human development, or investing in the people of Madhya Pradesh. The state and its leadership chose the second path. To invest in people, to make development people centred, the statement that best describes how the state government defines its strategy as looking to “people as the solution”.

As a part of focussing on people, the State identified certain immediate priorities and brought them under attention through the Rajiv Gandhi Missions in the State. The priorities decided at that time were education for children, elimination of iodine deficiency, reduction in case fatality rate in diarrhoea, increasing productivity of land and improving peoples access to water through watershed development amongst others. For each of these a Mission was established, with a goal, a time period, but no additional funds or staff. The Missions were brought onto focus on specific problems, problems that needed an inter sector and inter department action. These Missions ensured this, and also gave policy and executive priority to their objectives. Funds were taken from existing funds and schemes and staff from existing departments were put together under the umbrella of specific Missions, both at the state and at district levels. These personnel then co-ordinated and ran the Missions, and Missions ensured pooling together of resources, people, government and civil society. The change was in how management was seen—an institutional change in the way the term is used here.

The strategy adopted by the Missions was to focus on a problem, build a stakeholder network for such a solution (e.g. involving salt traders in the iodine mission), involving all concerned persons, setting time and goals that were not interfered with, and the Missions had an end in mind. The Missions are to be closed down, as some have, when they either accomplish their goals or are unable to do so. The Missions in some manner circumnavigated the existing government departments, but involved them when picking up Mission staff and the schemes. The reasons for not keeping the Missions entirely within departments was the inter sectoral need of the Missions and their objectives. Also the mission structures helped avoid delays through procedural problems that departments may have had, and also ensured that Missions are seen as not just department efforts, but as the governments' priority. The Mission structures from the top to field agencies involved people at various levels thereby adding legitimacy and ownership to the programme.

What has distinguished Missions from the manner in which government has functioned in Madhya Pradesh other wise has been:

- In most cases a well defined and planned strategy is usually missing
- In most cases there is very little focus on the medium for implementing or carrying through an effort, something Missions were more focussed from their start.
- In case of government department works, the institutional arrangements are traditional, while Missions innovated and used both the government arrangements and as and when necessary other arrangements.
- From initiation to implementation, government acted as a catalyst and a vehicle as far as the Missions were concerned, whereas in government department actions the government/ agencies are all-in-all
- In departments there is the looming question of “Ownership”, and “whose agenda” do departments carry forward. Ownership becomes departmental and agenda also get transformed into either departmental on individual issues. While there is an element of an individual or a group agenda associated with the Missions, since they are ultimately identified with the state political executive, yet there is a greater government ownership and it is the States agenda.

But there are issues on the Mission mode and we need to outline these. The idea of a Mission is that it is time bound and once a particular goal is achieved the Mission dissolves. Therefore it is imperative that while the strategy and institutional set up of a Mission is temporary its objectives and achievements are not, and how do we ensure that there is a continuity and permanence to what the Missions are doing? In case of short term goals like ensuring that we eliminate iodine deficiency through sale of iodised salt, closing the Missions has no problems. However, in the case of long-term programmes such as elementary education and watershed development, the question does arise what after the Mission? So how do we ensure that there is permanence to Missions and there is greater ownership of these within the state government.

The issue of permanence is valid to Missions with objectives that are longer term. The challenge is how much and to what extent the longer term Missions can now transfer themselves into the core departments and retain the efficiency and delivery effectiveness that they have achieved. Some of this has already happened. The Rajiv Gandhi Watershed Mission is within the Department of Rural Development and there is considerable department control and ownership of this Mission, and the Education Mission and School Education now has one common head. How much of the integration of Missions into departments will happen – will the departments gradually absorb and adapt to some of the good practices and manner of working that the Missions have successfully practised, the next few years will tell.

The mission strategy does bring out some facts — one is that it is often difficult to initiate strategic and institutional

changes within departments, and these take long periods to take effect, and even then after constant resistance by departments. Two, if immediate and urgent changes and focussed changes are required, governments established systems are not the best bet, and in action that requires inter-sector, and inter-department co-ordination and collaborative action, then a force or pull from outside any particular set up can ensure it.

1.3.2 Gram Sampark Abhiyan

From the year 1998, the Government of Madhya Pradesh started a process called Gram Sampark Abhiyan (GSA). It is a simple exercise, carried out over a week each year, where teams of government officials visit every village and habitation in Madhya Pradesh for a reality check. The teams are trained and provided with an elaborate questionnaire and a planned chart of activities to be conducted in the GSA.

The teams address Gram Sabha meetings, meet groups of people in all the habitations. They use a questionnaire to gather information on different aspects and register problems, observe and document infrastructure and condition of infrastructure (e.g. list all handpumps and observe how many are in working order), and implementation of key development schemes. The teams in the initial GSAs also noted down action points, prepared a type of demand list of villages, reviewed people's own problems related with government (e.g. people who have not received patta for land that was allotted to them etc.). The information so collected is put into questionnaires and in a village diary, the former are sent to janpad and district administration for documentation and necessary action and the latter remains in the gram panchayat.

Over the last couple of Gram Sampark Abhiyan, the objective of the programme and its content has changed. The process of generating a wish list and documenting it, as the first GSA landed up doing has been abandoned, and the programme has moved into a drive mode. A drive based on a theme is now one of the principle goals of the GSA, along with collecting information on functioning of government programmes – have people received the ration cards, is the nurse coming to the village etc. The self monitoring role of the abhiyan is one of its main purposes.

From last year the GSA has a specific theme, where the contact programmes are used to spread awareness on the theme, and collect specific information on the theme. A vibrant example of this was the Gram Sampark Abhiyan last year which focussed on water conservation in the backdrop of the severe drought that had hit the state. Simultaneously it also collected information on health from each village, to draw up district level health action plans. In both a great deal of local information was collected from which local demands were assessed and form the basis for action.

These contact programmes are high profile, and officials actually do visit habitations. Evidence of official teams visiting habitations and conducting Gram Sampark exercises are in

abundance. Along with teams, government officials from districts and the state level (including senior officials such as Principal Secretaries to the State Government), members of the State cabinet and the Chief Minister travel and visit villages to participate in this programme and take a check on the process.

Institutionally, this serves the overseeing function from the top—the decisions taken by local bodies must be respected and implemented—and the GSA is an instrument for ensuring that the local bureaucracy does what it is supposed to. This is important in forcing accountability from civil servants. The entire exercise is bureaucratic, both because the exercise is on the functioning and feedback for the bureaucrats and their bosses – both political and executive, and it is also an exercise in taking government literally to the people. This also ensures to some extent accountability to the top of field officials, who in turn are enforcing implementation of people's decisions under the direction of the political executive of the State.

The impact of Gram Sampark Abhiyan had been on two fronts. One is the collection of information on quality of government services, problems associated with the interface of government and people. District, Janpad and departmental action often follows location of problems in habitations and solvable problems get priority attention. The information so gathered is an excellent tool for active and motivated official and there are enough examples from across the state where such officials have used it to identify problems, and take suitable action. The Government has placed all the data collected during the Gram Sampark Abhiyan by village onto a web site (www.mp.nic.in/gramsampark) and this is open for public access.

Government resources and capacities are not adequate to address all the problems and demands recorded during GSA. In the first Gram Sampark while generating demand, wish lists were generated in villages, and raised high level of expectations. The raised level of expectations cannot be met as stated above. This has generated a sense of disappointment and even some cynicism, and impacted people's perceptions of the Gram Sampark Abhiyan.

There is also a problem of consistency and the quality of data gathered. However, it is no doubt that field realities are evident and in some platform they get recorded.

The other impact has been when GSA moved into a 'drive mode'. The utility of Gram Sampark Abhiyan as a check on governance is pretty good. On the other hand the use of Gram Sampark Abhiyan to generate demand has rightly been dropped as a goal of these campaigns. With the third GSA, the campaign undertook a drive mode and also attempted to make it clear that this is a monitoring tool and not a demand generation tool.

The theme of one of the GSA was *pani roko* (stop water) under the slogan – *khet ka paani khet mein, gaaon ka paani gaaon mein* – and this kind of caught the imagination of

people. Termed the Pani Roko Abhiyan, government initiated this call across the state, urging people in their communes and habitats to do something to stop water from flowing away, stop, and store it wherever it falls and wherever it can be stored. The Gram Sampark Abhiyan took this message to every village and ever villager. From across the state a large number of initiatives were taken to build structures for water conservation, stopping water and conserving it where it falls, etc. Government made part contribution and people contributed the rest, both in cash and kind and in labour.

The GSA impact and the success of Pani Roko Abhiyan showed how such a peoples contact programme can be effectively used, and also shows the thinking that such contact programmes are taken seriously and there is a determination to use them for development. This year the campaign took on the theme of sanitation.

Gram Sampark Abhiyan is taken with some seriousness. The Gram Sampark Abhiyan have also become a useful tool to launch public messages followed by programmes on such messages.

If we look carefully at the Gram Sampark Abhiyan, what emerges is that one it was not a one time effort that normally such campaigns are about, and there has been an element of sustainability and follow up to them. This does not state that the all the action objectives of the campaign are successful. Second, that once such a tool is available, other efforts of the government then utilises it in effective manner. It is also part of similar other efforts of the Government of Madhya Pradesh where they have created systems and processes that run parallel to existing government efforts, but draw their legitimacy, their strength and their logistics from the government. GSA has institutionalised ground level monitoring and feedback systems, and an effective mechanism to push through drive based initiatives, especially those involving public partnership.

1.3.3 Panchayats

The institution of Panchayat Raj was brought into modern independent India's political set up over four decades ago. The real impetus came only after the Indian Parliament passed the famous 73rd and 74th Constitutional Amendments in 1993. These amendments signalled the fulfilment of the promise made in the Constituent Assembly through Article 40. These two amendments facilitated the way for creation of institutions that would strengthen the process of participative democracy.

The constitutional amendments contained mandatory and discretionary provisions for the state governments within which they were expected to frame their respective state laws

for the local bodies. To enable the states to empower the Panchayats and the Urban local bodies with powers and functions a suggestive list was incorporated in the constitution as Schedule 11 and 12, respectively.

The state of Madhya Pradesh saw the amendments as an opportunity. It became the first state to legislate laws within the state to bring in the new panchayat system, it was also the first state to hold elections under the new system. The involvement of people in their own development, involvement of people in decision making and as participants in development through the institution of panchayats has in fact become a cornerstone of government policy and practise.

We will see later in this chapter that the structure of panchayats has also been evolving in the state and the change is not just in terms of administrative provision and rules, but substantial. From the time that the new Panchayat Raj system was established, there has been constant reflection on the system, and based on such an analysis two major changes were brought about. One is the District Government system, and the other the Gram Swaraj system. Both reflect clearly the States response to feedback, experience and reaction to the Panchayat Raj system in Madhya Pradesh.

1.3.4 The District Planning Committee (DPC) – Co-ordinating Institution

In pursuance of the Article 243 ZD of the Constitution the Madhya Pradesh Government enacted the Madhya Pradesh Zila Yojana Samiti Adhiniyam, 1995 that received the assent of the Governor on 19th May 1995. The Act was subsequently amended in 1999 to make the provisions comprehensive in nature and enable the establishment of Zila Sarkar (District Government) in the state.

The Zila Yojana Samiti Act provides for the constitution of the DPC in all the districts of the state. Further, the districts were categorised as comprising of 15, 20 or 25 members in the Committee. The membership to DPC has been provided to the elected members of the Panchayats, Municipalities, President Zila Panchayats, and the *Prabhari* Minister of the state government¹³ and the District Collector. The *Prabhari* Minister has been designated as the Chairperson of the Committee.

As DPC, the Committee has the powers of planning, raising resources for financing their plans, and to monitor and evaluate the programmes and schemes that are implemented under the system of decentralised planning, including the money to be allocated by the MP/ MLA fund.

As District Government, the DPC is vested with considerable administrative, executive, financial and legislative powers. For example, the DPC have the powers to transfer class

13. The State Government has a Minister designated to specially look after the interests and development of each district. This minister of the State cabinet is called the *Prabhari Mantri*.

II, III and IV officers of the district that have not been transferred to the Panchayats. The departments' heads in the district are expected to take the permission of the Chairperson DPC for expenditures for which they used to take the permission of the state government previously. To ensure that there is no overlap with the Zila Panchayats, the orders of the departments specifically state that the DPC has the powers over the schemes that have not been transferred to the Panchayats.

The main aim of decentralising the powers at the district level is to reduce the delay in securing sanctions and to empower the people's representatives at the districts to take decision at the district level itself. The DPC being a body entrusted with comprehensive powers over all departments, the administrative decision-making can take place at the district level. As an enabling provision, the Collector has been made the Deputy Secretary in all the departments at the state (except Home), to fulfil the objective.

The system of District Government implemented through the mechanism of the District Planning Committee must be seen as a measure of administrative decentralisation, and not as a measure of decentralisation per se. The State Government has faced criticism for the District Government system, and critics maintain that it has provided for backdoor entry for elected MLAs and State Ministers and District bureaucrats to intervene in the rights and duties of panchayats and urban local bodies. Criticism also says that the District government has re-inforced the status of the District Collector. What is important to note here is that while many of these criticisms may be true and borne out of personal experiences across districts, what the District government have done is to decentralise administrative decisions from the centralised offices at Bhopal to districts. District Planning Committees under the District Government today have considerable powers to give technical and financial sanction to large projects hitherto undertaken by Departments at Bhopal. What DPCs have done is to ensure that decision come home, in the sense that stakeholders from the Districts are involved in decision making, rather than distant bureaucracies, and more stakeholders are involved

2 INSTITUTIONS IN ACTION - EXAMPLES FROM THE FIELD

We will look at two examples of institutions and institutional evolution in the last eight years to observe what trends have been followed. These are the Panchayat Raj and Gram Swaraj set up in Madhya Pradesh, and the Rajiv Gandhi Missions. While the first is a concrete example of the manner in which government implements its commitments, in the second we will see how systems and processes have evolved.

2.1 Panchayats

This is the only section where we will tackle in detail the organisational set up in Madhya Pradesh. This is done for two reasons – one is that at the cutting edge level, panchayats are

the mechanism for implementing governments action, and two the institutional and organisational strength and evolution of panchayats are significant.

The functional usefulness of Panchayat institutions lie in strengthening democracy at grass roots and in institutionalising a system that is based *on the willing assent of the people and not the coercive power of the state*. The very existence of these institutions provide an opportunity to the people to state *their own views about their needs and difficulties and (that) the correct solutions must be elicited and given the fullest weight in making the plans, in the execution of which they will be called upon to assist*.

Thus, Panchayats as institutions and Human Development as the goal of all planned development has the following three dimensions:

- as *decentralised institutions* that play an effective role in furthering the national goal of human development
- as *representative institutions* that are able to express the local concerns for human development and undertake consequent action
- as *enabling institutions* that create opportunities for the local human resource to practice their skills for self-governance

The ensuing paragraphs uses this three dimensional framework to assess the role played by the Government of Madhya Pradesh in developing and strengthening the Panchayat institutions in not only fulfilling their constitutional obligation, but also in playing a pro-active role in developing the potential of human resources in the state.

2.1.1 The Framework for Panchayats

The policy of the State Government towards Panchayat Raj institutions was given effect through the circular titled *Guiding Principles: Decentralisation of Powers, Responsibilities and Programmes to Panchayats* in October 1996. The circular propounded the vision of the state with respect to Panchayats in general as well as in reference to each level of Panchayat in particular (see Box on Guiding Principles)

The guiding principles were a major breakthrough for the state in transferring the work, the staff and the budgets to Panchayats. In pursuance of the principles, works of 23 departments and the budget under demand number 15, 80 and 82 of these departments was placed at the discretion of Panchayats institutions. Each of these departments have issued circulars and orders that effectively transferred their work, as well as issued orders that transferred some staff under the purview and control of Panchayats

Since 1994 there have been two rounds of elections for Panchayats in the state- 1994 and 2000. These two elections were held before the formation of Chhattisgarh state. After the bifurcation of the state, there are 22029 Gram Panchayats in the state. The details of number of Panchayats and their representatives is given in Table 1.

Guiding Principles of Devolution of Power to PRI

Role of state government will be that of a policy regulating agency

- Panchayats should be developed as institutions of self-governance and not merely as institutions of local governance
- Zila Panchayat should gradually evolve as district government and Block Panchayat should become its main administrative unit.
- The main responsibility of Panchayats is to plan for economic development and social justice. To enable Panchayats to fulfil this role the staff and the budget should be transferred to the Panchayats.
- At the district and sub-district level the work should be distributed between the State and the Panchayat sector. This division should avoid duplication of control and authority of state and Panchayat sector.
- Gram Panchayat be given functional control of those departments that needs to be managed at the local level
- Participation of Panchayats to be ensured while preparing welfare and development programmes
- State employees will work for the state government and the Panchayat employees will work for the Panchayat. There may be officials from the same department under the Panchayat and the State sector- their roles and responsibilities and co-ordination should be well defined
- Since the work of the departments has to be transferred to the Panchayats all the budget with the exception of establishment cost should be transferred to Panchayats
- The power of the departments should be given to an institution, and not to any particular official.
- The process of use of powers should be based on rules of procedure in the same manner as the state government. For this working rules and procedures should be prepared for Panchayats that will define the roles and responsibilities of the committees and the officials are empowered to take decisions.
- In no condition the Panchayats will be given the adhoc control of departments. Either there will be no control or there will be total control of Panchayats.

There are 3,44,424 Panchayat representatives in the state, which includes 22,387 members as leaders of their respective Panchayat bodies. Among these 61.4 per cent of the representatives belonged to the Scheduled Castes (15.6 per cent), Scheduled Tribe (27.6 per cent) and Other Backward Class (18.1 per cent) categories. Of the total representatives 33.8 per cent are women.

In pursuance of the mandatory provisions of the 73rd Constitutional Amendment, the State Government had also constituted the First and the Second State Finance Commission to decide upon the principle of devolution of funds to the Panchayats. The Second Finance Commissions has also submitted to report.

The State Government that is responsible to conduct elections for Panchayats has also constituted the State Election Commission. In past the Election Commission has conducted two general elections and elections for seats and posts as and when they become vacant.

The section 129 of the Madhya Pradesh Panchayat Raj and Gram Swaraj Act, 1993 provides for the constitution of separate Audit Organisation for the conduct of audit of Panchayats. However, this organisation has not been formed in the state and the functionaries of the Department of Panchayat and Social Welfare are currently carrying out the audit.

2.1.2 Legal Framework

The legal framework for the Panchayat institutions is defined by the Madhya Pradesh Panchayat Raj and Gram Swaraj Act, 1993; the Madhya Pradesh Zila Yojana Samiti Act, 1995 and the Rules; Orders and Circulars that have been passed to give effect to various provisions of the Act. The Act provides for a system of three-tier Panchayat institutions, Zila Panchayat at the district, Janpad Panchayat at the block, and Gram Panchayat at village level (population of 1000).

The Act is universal in its application as it applies to the revenue and forests villages in the state. There are certain differences in the way the Act is applicable in the Schedule and non-Schedule areas of the state (see Box on Special Provision).

The Constitution has laid down special provisions for the welfare of the members of the Scheduled Tribes in the country. Areas with concentration of tribal population have been

Table 1: Number of Panchayats and Representatives in Madhya Pradesh

Source : Department of Panchayat Raj, Government of Madhya Pradesh

specially designated as (a) Tribal Areas in the North-Eastern States of Assam, Meghalaya, Tripura and Mizoram; and as (b) Scheduled areas in other states of the country. The former is governed by the Sixth Schedule and the latter by the Fifth Schedule of the Constitution.

The MP Panchayat Raj and Gram Swaraj Act, 1993 has been suitably modified to incorporate the provisions of the Extension Act of the 73rd Amendment Act to provide for the Panchayats in the Scheduled Areas (vide amendment MP 43 of 1997 [5-12-97]). There are 4 districts in the state that are wholly categorised as Scheduled Area districts and 12 districts as partially Scheduled Area districts. The District, Block and Village Panchayats in each of these categories are given in Table 2.

There have been 12 amendments to the state Act since its enforcement. These amendments have been substantive in nature, the most notable being the amendments on 5th December 1997 and the amendment on 22nd January 2001. The former created the distinction between the Scheduled and non-Scheduled Areas in the State and the latter affected the change in the name of the Act to Madhya Pradesh Panchayat Raj and Gram Swaraj Adhiniyam, 1993. It also extended the provisions of the Act to Gram Sabhas in the State. Every Gram Sabha in the state has been recognised as a legal entity and the system of working through the committees have been extended to the all the Villages.

2.1.3 Gram Swaraj

The existing panchayat system was constantly criticised for two major weaknesses or problems. One was the growing and almost over bearing influence of Sarpanch over the panchayat, and the second was that the Gram Sabha was not able to establish its role, character and importance and there was dwindling interest in Gram Sabhas and therefore declining attendance in its meetings. The Gram Sabha actually had considerable powers under the existing provisions of decisions and planning, but most of this has become redundant in practise.

Recognising both these problems, the idea of Gram Swaraj was evolved, inspired by the ideals and thinking of Mahatma Gandhi. Empowering Gram Sabhas further and granting them a greater role, the idea is to tone down the

Special Provision for the extension of Panchayat Raj in fifth Scheduled areas

- Separate Gram Sabha for each village in Schedule Areas. Moreover, separate Gram Sabhas can be constituted for a hamlet or a group of hamlets
- The meeting of the Gram Sabha shall be presided over by a member of the Gram Sabha belonging to the Schedule Tribe only. Any elected member of the Panchayat, Sarpanch and Up-Sarpanch cannot preside over the meeting of the Gram Sabha.
- Gram Sabhas have the power to safeguard and preserve the tradition and the customs of the people, their cultural identity, community resources and the customary mode of dispute resolution.
- Gram Sabhas can exercise control over institutions and functionaries in all social sectors transferred to the Gram Panchayat
- Gram Sabha has the power to manage natural resources including land, water and forest within the area of the village in accordance with its tradition and in harmony with the provision of constitution and with due regard to the spirit of other relevant laws for the time being in force.
- Gram Sabha can give advice to Gram Panchayat in the regulation and use of minor water bodies
- Gram Sabha can manage village markets and fairs including cattle-fair, by what ever name called, through the Gram Panchayat
- Gram Sabha has the power to control local plans, resources and expenditure for such plans including tribal sub-plans.

unnecessary influence of the Sarpanch and to give a comprehensive role to Gram Sabha so that people find it worthwhile to attend the meetings and thereby participate directly in their concerns – a change towards direct democracy.

The Madhya Pradesh Government amended the Madhya Pradesh Panchayat Raj Act to give effect to Gram Swaraj in the state. The amendment has brought in substantive changes in the Act and in the nature of Panchayat institutions, especially at the village level. The main features of the amendment are given in the box on Gram Sabha.

2.1.4 Panchayats as Decentralised Institutions

The role of Panchayats, as institutions that can play an effective role in furthering the goals of human development, is dependent on the powers and functions that have been transferred to these institutions and the enabling provisions that accompany these powers. In this context it will be important to assess the extent and the degree to which the State Government has de-centralised its powers and functions at the district and sub-district levels.

Administrative decentralisation: The state government in pursuance of its policy of strengthening Panchayats as institutions of self-governance has demarcated the work of departments at

Table 2

Status of District	District	Block
Districts that are wholly declared as Scheduled Areas	4	35
Districts that are partially declared as a Scheduled Area	12	40
- Non Scheduled Blocks		63
Districts with no Schedule Area	29	175
Total	45	313

Gram Sabha - New Role under the Gram Swaraj Initiative

- The Gram Sabha of every revenue and forest villages in the state has been recognised as a legal entity. That is, the Gram Sabha can sue and be sued, and it will have its own seal and signature.
- The Gram Sabha itself will convene the meeting of Gram Sabha. One meeting of the Gram Sabha every month is mandatory.
- The condition for the fulfilment of the quorum has been made mandatory for the meeting of the Gram Sabha. The quorum for the Gram Sabha is 20 per cent of the membership of the Gram Sabha. Of the members present one-third should be women.
- Decisions in the Gram Sabha will be unanimous. In case there is dispute attempts will be made to arrive at a general consensus, and if the matter is still not resolved the majority opinion will prevail.
- There is provision for appeal on the decision taken by the Gram Sabha.
- Every Gram Sabha will constitute seven Standing Committees, namely, Agriculture, Education, Health, Infrastructure Development, Community Resources, Village Protection, and Social Justice. The Chairpersons of each of these committees along with the Sarpanch and the Up-Sarpanch of the Gram Panchayat will constitute the Village Development Committee.
- The amendment is flexible enough to provide space to the Gram Sabha to constitute ad hoc committees for specific work. These committees could be made and dismantled by the Gram Sabha.
- Every Gram Sabha will have a Village Fund, comprising of the Cash (bank) fund; the Grain fund; the Labour fund; and the Material Fund. The purpose to which this fund will be put to use will be decided by the Village Development Committee.
- Gram Sabha has been entrusted with the responsibility of the village; of the work that is to be performed by the Gram Panchayat (eg express opinion on the budget of the Panchayat, and its annual audit etc); control over natural resources and control over institutions and their functionaries. With respect to responsibility of the village the Gram Sabha will lay down the principles for implementation of development schemes, identify families below poverty line, and controlling the implementation and monitoring of beneficiary oriented schemes. The Gram Sabha also has the responsibility of ensuring equality of benefits in the implementation of various schemes and programmes.
- Gram Sabha has three sources of income- donations, receipts from Panchayat Nidhi, and taxation. As a legal entity, the Gram Sabha has the option of imposing Profession tax and Public Property. At the same time it has to levy and collect building tax, professional tax, tax on services provided to the village.
- Every Gram Sabha will ensure that there is annual audit of its accounts.

the district level to the offices of the Panchayat sector and offices of the State sector.

The powers and functions of many departments have been demarcated in to the office of the Panchayat and the office of the State sector, and transferred to the Panchayats at the district level. The offices of Panchayat sector have been placed under the direct control of Zila Panchayats. The budget, staff and other functional powers have also been transferred to the Zila Panchayats.

This transfer of staff has created confusion amongst field officials and affected direct line hierarchies in government. Who does the field staff report to, how do departments handle staff implementing their programmes but technically with the zila parishad now? It is a departmental turf issue, and even for employees, the duality of reporting and identity has its own set of problems.

Financial decentralisation: The state government has taken pioneering steps to provide increased finances to the Panchayat institutions through budgetary decentralisation and other steps taken to expand the resource base of Panchayats. The former includes transferring the money voted under demand number 15, 80 and 82 (see Box) to Panchayats. The latter has been ensured by accepting the recommenda-

tions of the Finance Commission where 2.91 per cent of the total revenue (tax and non-tax) of the state has been earmarked for Gram Panchayats. In addition, the state government is also sharing revenue generated through stamp duty, receipts collected through Professional tax, cess on Education, and Land revenue with Panchayat institutions. An important step for increasing the control of Panchayats on the usage of funds in the district has been the merger of the DRDA with Zila Panchayat. As a result the money allocated from the central government for rural development under centrally sponsored schemes is now disbursed on the recommendations of the Zila Panchayat.

The extent and nature of powers and functions that have been delegated to Panchayat institutions in Madhya Pradesh makes it clear that the State Government does not perceive Panchayats merely as extended arms of the government or as institutions that will increase the outreach of its services. On

Demand number 15: Financial assistance to Panchayat institutions under Special component plan for Scheduled Caste

Demand number 80: Financial assistance to Panchayat institutions

Demand number 82: Financial assistance to Panchayats under tribal sub-plan

the contrary, the Panchayats have been perceived as, and developed as, decision-making bodies within the overall control and management of the village communities. It is this character of Panchayats in the state that has taken them beyond the scope of decentralised structures towards the framework of institutions that have a critical role in Human Development.

2.1.5 As Representative Institutions

The degree of autonomy enjoyed by the communities, which is reflected in the opportunities that exist for the communities to take decisions and in the decision-making processes that allows the community to exercise their choices is a crucial indicator in the status of development that people and communities enjoy. This gives democracy an intrinsic value that guides the functioning of all institutions and makes participative democracy a cherished goal for the institutions of self-governance. It is within the dynamic the framework of decreasing dependency of communities that Panchayat institutions find a reason for their existence and define their critical role in Human Development.

Effective governance is based on the nearness of the governing institution to the communities. In Madhya Pradesh, the smallest unit of representation is defined by a ward that is constituted over a population of 100 persons. The Gram Panchayat, that forms the institution, is constituted over a population of 1000 persons. With the recognition of Gram Sabha as a body corporate, comprising of persons entitled to vote within its territory, has effectively located the institutions for decision-making in the village itself. Further, to enable the Gram Sabha to function as a body corporate the state government has provided for the constitution of eight standing committees of the Gram Sabha that has further widened the institutional base of the Gram Sabha in the community and has created opportunity for the community to take specific decisions.

The major role assigned to Panchayat institutions, in Madhya Pradesh, is planning for economic development and social justice. Every Gram Sabha and Gram Panchayat is expected to prepare plan for the development of the village that will be consolidated at the Janpad level and later on at the Zila Panchayat level. The process of planning is expected to involve all sections of the community through the Standing Committees at the Gram Sabha and the Gram Panchayat level. The village community constitutes the former and the Panchayat representatives (Sarpanch and Panch) comprise the latter. These committees represent multiple institutional spaces within the framework of Panchayats to address different issues and concerns.

Thus, the creation of multiple institutional platforms equipped with substantive powers are indicative of the process where the communities do not have to depend on institutions that are far away and appear as inaccessible monolithic organs of the state. With governance becoming everybody's concern

the responsibility for achieving the development targets shift towards the community and its institutions. For example, goals of universal immunisation or universal literacy or IMR of 40 are as much the targets for local institutions as they are of the state. In fact the role of the state changes from a mere provider of services in a supply driven mode to that of an agency that facilitates the communities to achieve their respective targets. And this very fact of changing roles and responsibilities poses the biggest challenge to the state government in Madhya Pradesh.

Emergence of panchayats and urban local bodies empowered institutions for governance imply a change in the roles and functions of existing institutions, namely the administrative departments, who have to change from dispensers of administrative largesse to reluctant partners with communities. Delegation of powers to Panchayats implies an inevitable reorientation and redefinition of the role of the administrative departments. It also implies development of a mind-set among the officials that goes beyond considering Panchayats as a necessary irritant or even evil to be tolerated, towards an approach that is positive and pro-active towards Panchayats as an institution and towards Panchayat representatives as people's representatives.

2.1.6 As enabling institutions

The concept of Panchayat institutions is rooted in the socio-political history of the country, yet their recognition as formal institutions of governance and the development role that is assigned to them requires time before it can be internalised by the community and the institution itself. For example, delegation of powers does not *ipso facto* imply that people will start using it, or it will be used in the manner and for the purpose for which it has been designed. Thus, the role of state as the provider of information and as the regulator of institutional functioning assumes greater importance. That is, the challenge before the state is to ensure that Panchayats function as institutions that allow people to practice their skills of self-governance. The challenges are posed by the following structural and systemic factors:

Response of established power centres: Panchayat institutions equipped with popular support and powers and functions of the state have emerged as new power centres in the community. The established power centres in the community have been challenged and have been forced to respond to Panchayats. The preferred reaction of existing power structures has been to co-opt these institutions within their fold so as to retain their power base in the community. However, the larger community has woken up to this process of co-option and has publicly challenged their dominance. In such a situation the state cannot remain neutral and has not only to provide protection to the community, but has to demonstratively establish the dominance of Panchayats as institutions of self-expression for the people and individuals.

Centralisation within decentralisation: Within their own institutional framework there are possibilities that decision-making is centralised in a post or in few hands. The State Government identified the dominance of Sarpanch as the sole decision-making person in the Gram Panchayats that led to the enactment of the Gram Swaraj within the Panchayat framework. The state government needs to be vigilant to the processes of decision-making at all levels in the Panchayats so that neither individuals nor any constituent of the institution gain dominating power and start affecting the decisions in the institutions.

Institutional negotiations: Panchayat as an institution are in a position where they need to negotiate with line departments and interact with government officials on a daily basis. The sources of information and the skills for administration are however, in the hands of the latter and they are not willing to share these with Panchayat representatives. As a result the Panchayats find themselves handicapped during the process of institutional negotiations and often complain about their passive role in the process of overall decision-making. The responsibility for ensuring a level playing field for the Panchayats is that of the state government that will have to review its strategy for flow of information to the Panchayats and to the community.

Financial decentralisation: The debate in Panchayats so far has focussed on how much of their own resources have the State Government shared with Panchayats. The quantum of resources transferred to Panchayats has become the index for effective decentralisation. However, the option of strengthening Panchayats as institutions that can generate their own resources has not entered the arena of public debate, nor Panchayats have been assessed as institutions that can become financially self-sufficient. The challenge before the state government is to find alternative ways in which the Panchayats can have adequate resources for their own plans.

Accountability mechanisms: The responsibility for effective functioning of Panchayats is as much of the institutions itself as it is that of the departments at the district and the sub-district level. This necessitates monitoring and accountability systems within the administrative and Panchayat institutions. The main focus for the former is to assess the quality of support provided to Panchayats where as for the latter it is necessary that its functioning becomes transparent and accountable to the community. On both counts the State Government has to assume the responsibility of instituting accountability mechanisms that are able to monitor the functioning of both the departments and the Panchayats in terms of their respective assigned roles as well as the activities undertaken that complements each other's role.

2.1.7 Gram Swaraj and Panchayats

Gram Sabhas have been at the core of Panchayat Raj Institutions, and the Acts as well as the spirit of Panchayat Raj make Gram Sabha the supreme body for all decisions. Following the new Panchayat Raj system in the state, the Government of Madhya Pradesh to ensure regular Gram Sabhas ordained that there will be four compulsory Gram Sabha meetings every year – one each on 26th January, 14th April, 15th August, and 2nd October. While earlier the Gram Sabha meetings were to be held on these dates specifically, this was later modified to over a week around these dates. Most observations and studies on Gram Sabha brought out the following –

- While Gram Sabha meetings were held on the dates, attendance was very poor. Except for times when beneficiaries in programmes were to be decided usually attendance would range from a dozen to two dozen persons.
- Usually Gram Sabha members close to or supporters of the sarpanch would dominate such meetings thereby denying these bodies the characteristics of a democratic body.
- Many people observed that the issues debated or discussed or dwelled upon in Gram Sabha were mundane matters such as budgets etc., and were of little if any utility to people. Hence, attending these meetings was not of much use. Further, domination by group or groups would dissuade others.
- Sarpanch and his supporters on their own would often use existing rules and provisions of quorum to their advantage and use such meetings to ratify decisions that suited them.

The problems, both of low attendance and dominance by some were seen by the State Government as a crucial bottleneck in making Panchayat Raj system even more democratic and effective. There was also growing concern over an expanded and over powering role of the Sarpanch. Both these prompted the State Government to take measures to ensure a greater and more effective role for Gram Sabha. The changes under the Gram Swaraj initiative have tried to provide a much greater and critical role to Gram Sabha, taking them down to the level of every habitation. From the 26th of January 2001, amendments to the Act in Madhya Pradesh have heralded this new system in the state.

Gram Sabha – an empowered body: The enactment of the concept of Gram Swaraj has brought about a qualitative change in the character and nature of Gram Sabha in the state. The Gram Sabhas are now a body corporate with their own seal and succession. In addition, they have been entrusted with the powers and functions to:

- exercise control over government functionaries
- undertake planning
- identify/ approve beneficiaries under different schemes
- provide approval to proposals before they can be implanted in the village

- control and manage various programmes of government.
- Co-operate with other agencies for the implementation of their activities
- undertake the review, monitoring, inspection and supervision of government programmes in the village
- maintain records and accounts at the village level
- maintain structures created under various schemes
- perform a facilitative and promotional role towards the development of their village

The wide ranging powers given to Gram Sabha and its eight committees has suddenly changed the equation in which panchayats and the elected representatives were working. There has been a reduction in the role of the Sarpanch, greater involvement of people in decisions, more need for regular and attended Gram Sabha meetings. With hardly a year gone by under the new enactment it is very early to say anything with regard to what is going to happen. However it is important to note some of the issues that emerge with the Gram Swaraj led changes in the state panchayat system.

One is that under the previous Panchayat Raj system, while there were many Sarpanch who dominated and controlled gram panchayats, it also gave power and built leadership amongst weaker sections and women. The last six years are filled with numerous examples of such empowerment. The reduction in the role of the Sarpanch has taken away this one opportunity that men and women of weaker sections and women in general got. Under the Gram Swaraj initiative, what roles will the Sarpanch play is yet unclear? The situation, role and context of the Panch is even more uncertain. Another point is that while earlier the Gram Sabha were called four times a year but often not attended well, yet there was the Sarpanch who had to call these meetings and ensure that they are at least held. With the Gram Sabha directly exercising the powers hitherto with Sarpanch and Gram Panchayat, who will ensure that these meetings are held and held properly.

The eight Gram Sabha committees are new, and need great amount of work upon them to make them active, aware of their roles and responsibilities. There is evidence from field that wherever work concerning committees came, especially in the form of funds, these committees became active, while other committees in the same village are dormant. The evidence is clear; the State Government will have to ensure that powers, responsibilities and funds are made available to these committees, if they are to become effective and active.

2.2 Missions – from 1993 to 2001

Rather than tracing the history and changes within the Missions, we will try and see how the Missions have evolved over the last eight years. We will also look at the example of the

new Rajiv Gandhi Swastha Jeevan Sewa Guarantee Yojana and how it has come about.

The Missions initially developed a tendency of building parallel implementation structures to panchayats, although panchayats were involved in ex-officio capacities. Most Missions and many departments developed parallel mechanisms – Joint Forest Management Committees, Watershed Development Committees etc. These parallel structures have been a matter of debate as discussed earlier. While parallel committees subvert the authority of panchayats, parallel structures also increase people's direct participation in development.

Over the last eight years the experience of developing parallel structures and then integrating them with panchayats has also produced positive changes. To integrate these, and to ensure that there is a co-ordination between panchayats, the Gram Swaraj initiatives have provided an ideal platform. Under the Gram Swaraj changes, every village will now have separate committees to oversee different development operations¹⁴, all under the umbrella of gram panchayats. These committees provide a valid platform for integrating programme user groups with such committees. The department of education has already taken a decision to dissolve all committees under it and merge them with the gram panchayat education committee.

Another change of significance has been rationalisation of Missions. Missions that have won the test of time by being sustainable, effective or which had long term goals continue. Those that either achieved success (such as the Missions for Elimination of Iodine Deficiency and Mission for Reduction in Diarrhoea Deaths), or those that somehow could not take off or find a direction (such as the Mission on Sanitation or the Mission on Advanced Technology), have been closed down. The ones with long term goals such as those for education and watershed development have remained state wide Missions. This has been an evolution in the Mission system, and reflects a strategic thinking and manner of working, even in a high profile, and politically sensitive group of programmes. The new Missions being added to the current list are those with longer-term goals and agenda, such as the Mission on Community Health. It is in the light of this that we take a look at the new health scheme launched in the state a few months ago.

Rajiv Gandhi Swastha Jeevan Sewa Guarantee Yojana

The initial Missions were specific goal focussed, and some targeted larger objectives, such as universalising primary education. The accumulated experience of the Missions, specially the experience of the Education Guarantee Scheme was brought into the planning and design of the latest State

14. In all eight committees.

Mission on health. The details of the Mission are not important to us, what is, is the manner in which this Mission was planned and its elements brought together.

In its focus on human development, the area of health was still the most disturbing with few achievements. In response to this, the State Government began an exercise in thinking about how and in what manner can a sustained and comprehensive health Mission be launched. In the design of this Mission many of the lessons of previous Missions was also utilised.

The Gram Sampark Abhiyan held from 3rd to 7th February 2001 across the state collected information on the current status of health provision, providers, pockets of diseases, key determinants of health, etc. This information has been put together in the form of a Village Register Plan, on the basis of which a Village level Health Plan will be formulated. The specific needs of each village will then become elements to which the health mission will be expected to respond—much as the EGS was framed. The Village level Health Plan, in turn are being aggregated at the district level to form District level Health Plans. These Plans will not only feed into the health guarantee scheme but also feed into the overall health programmes. Demand and supply are matched this way.

The Health Guarantee Mission has evolved in the following aspects – the Mission is housed in the Department of Health, with Commissioner Health the Mission Director. Another very important component of the scheme is the role of Gram Sabha. The Gram Sabha members of every village are to select amongst themselves the Health Committee of stakeholders or the Gram Swasthya Samiti, under the aegis of the Gram Swaraj related changes in the Panchayats Acts. These committees have at least 12 members out of whom fifty per cent belong to Scheduled Castes, Scheduled Tribes and Other Backward Classes (2/3 SC/ST and 1/3 OBCs) and thirty three percent women members. The members from amongst themselves will elect the president of the committee for a term of one year. Preferably the local village Dai, or the resident Jan Swasthya Rakshak will be nominated as a secretary of its Gram Swasthya Samiti. This committee will also be responsible for maintaining the Village Health Registers and formulating the Village level Health Plan. All the personnel and provisions under the Health Guarantee scheme will be under the authority of the Gram Swasthya Samitis.

The evolution of the Mission structure in these key organisational arrangements – one that department is directly involved, and two that panchayats play a central role – are signals of evolution of the Mission approach, and that Missions are now getting grounded within the state systems.

3. BY WAY OF CONCLUSION

Students of decentralisation will undoubtedly point out that the Madhya Pradesh experiment is one of decentralisation from above in which senior civil servants have played an

important role in guiding the process in a particular way. The major import of this point is that this has not been something that the people at local levels have done; that they would have done things differently; and that therefore there is something both undemocratic and undesirable in what has happened in Madhya Pradesh in this time.

Madhya Pradesh, in the centre of the Indian mainland, was traditionally a largely feudal state, with many districts in the north, north central and western borders under feudal principalities, and other districts under kulak peasantry. In the last century or so, and even after India gained Independence, the state has not witnessed any people's or social movements or significance. This is not to state that peoples movements in Madhya Pradesh are not of significance. But what we refer to here are large scale people's or social movements. Not only has there been an absence of changes in the social and political fabric of the state from people's efforts, the state has had a severely under developed and backward infrastructure, poor education and health set up and poor industrial and land base.

It is from this starting point that we need to see Madhya Pradesh – feudal, backward, a conglomeration of different regions. There have been no peoples movement in human development as was the case in Kerala, or co-operative movements of the sale witnessed in Gujarat and Madhya Pradesh, no rationalist movement as in Tamil Nadu. Then how does change begin?

Yes, change has been from above? But it is also a vision of the Chief Minister of the state. What is important is what direction is this change taking? This is what is important, and yes, it also has a democratic base as a politically elected executive spearheads it, sets the priorities and provides support and backing to it.

That decentralisation has been a process guided from above is a basic truth. India has a system of governance in which the state governments have the responsibility to set up and empower local bodies as they deem fit. The constitutional amendment has deepened the federal principle that form part of the basic structure of the constitution—from a union of states with state and union government, India is moving towards a union of local governments and state governments. From a two tier structure that has worked from 1952 to 1993, we are now moving, with the initiative coming from the states, to a three tier structure that, in addition to union and state governments, has three levels of panchayats and in urban areas, municipalities or nagar palikas. This is a fundamental change that will in time bring about major changes in many of the organisations and institutions that we have been familiar with. This report looks at one small slice of time in just one state—the big picture will take time to emerge—in this evolving scenario. Different states have done this differently. That is a basic truth. But does it nullify ground experience?

In Madhya Pradesh, given the long feudal history—the term perhaps is used loosely here—a process that did not have support at the highest levels of the state government would have been captured by local vested interests. This could still have happened in many parts of Madhya Pradesh—time will tell. Given the low capabilities of elected representatives at local levels, they would have been unable without support to achieve any of their goals. The question therefore is this: has the higher level system functioned in an equitable and democratic way? Has it empowered local people to meet their goals? Has it responded to their needs when they were, however hesitatingly, expressed? Has it given space for dissent, for those who agreed on the goals but differed on the

means being used? Have the first crucial step in an ongoing process of transformation been supportive of long term change? There can be differing answers based on experience of different regions of the state, based on differing political philosophies and different readings of historical experience. These differences have to be openly discussed and resolved.

If the answers to some of these questions are “Yes”, then the overall process of institutional change in MP has been in the right direction. That is the thrust of this chapter. It can only end on a note of caution: the [limited] success of the past few years is no guarantee for the future. Care and caution must continue to the watchwords as the process proceeds. Eternal vigilance is, after all, the price of democracy.

Widening Inter-Regional Disparities in India

Right from the beginning of planned development in India, the issue of regional egalitarianism has occupied centre-stage. The theme of balanced regional development has been integral to all the Five-Year Plans framed so far. As far back as the Second Plan, the question was addressed as follows: "In any comprehensive plan of development, it is axiomatic that the special needs of the less developed areas should receive due attention. The pattern of investment must be so devised as to lead to balanced regional development. The problem is particularly difficult in the early stages when the total resources available are very inadequate in relation to needs. But, more and more, as development proceeds and large resources become available for investment, the stress of developmental programmes should be on extending the benefit of investments to underdeveloped regions. Only thus can a diversified economy be built up. These considerations have been kept in mind while formulating the Second Five Year Plan, but they are certain to claim even greater attention in the plans to come".

These words were prophetic. The issue continues to be of concern today, as expressed in the Approach Paper to the Tenth Plan, which specifically addresses the issue of uneven growth in the context of states. The Approach Paper notes that "the Plan has traditionally focused on setting national targets but recent experience suggests that the performance of different states varies considerably. For example, although the economy as a whole has accelerated, the growth rates of different states have diverged and some of the poorest states have actually seen a deceleration in growth.

Finance Commissions, which deal with constitutional centre-state transfers of tax revenues, have reflected this by their concern for "horizontal equity". In turn, these concerns, expressed by Finance Commissions and the Planning Commission have been translated into formal structures and formulae for the flow of resources for development, and the direction of industrial policies. Through the decades since independence, economic policy-makers have consistently sought to centrally manage and direct development resources into the lesser-developed parts of the country.

In this chapter, we seek to consider the regional dimensions of development with special reference to Madhya Pradesh. This is broadly looked at in two parts. In this chapter,

the comparative trends in the growth of the economies of the major states since the early sixties are outlined, along with more recent comparisons of inter-state profiles of poverty and human development.

INTER-STATE COMPARISONS : GROWTH, POVERTY AND HUMAN DEVELOPMENT

Income Growth

The growth performance of states can be tracked by the data on State Domestic Product (SDP), which is reported by state governments and compiled by Central Statistical Organisation (CSO). CSO does not standardize the data or attempt to make them consistent with each other or the national accounts. However, while there exists this lack of consistency in the SDP data across states and in respect of the national accounts of the country, it is nevertheless used to analyse the growth of states. There have been recent studies on the subject by Ahluwalia (2000), Kurien (2000) and Chaudhuri (2001). Similarly, development economists have been comparing growth across different countries despite the data not being always fully comparable. The caveat is that while broad conclusions can be drawn from these data, too much significance should not be accorded to relatively small changes in indicators.

Further, while Gross State Domestic Product (GSDP) is considered standard for making per capita income comparisons in the current period, in the period before 1979-80, estimates of state income were available only in terms of Net State Domestic Product (NSDP). Accordingly, following the analysis of Chaudhuri (2001), NSDP is used for the pre-1980-81 period while GSDP is used for the post-1980-81 period.

The State of Madhya Pradesh was formed in 1956 pursuant to the States Reorganisation Commission recommendations. In the year 2000, this state was divided into the states of Madhya Pradesh and Chhattisgarh. In tracking the long run trends of growth, and a number of other indicators, it is the undivided state that is used as a basis of inter-state comparison, since data is available only for the undivided state in the period 1956-2000. Where subsequent comparisons are possible e.g as from the Census 2001 data, these have been used. However, since the essential features of the present state remain similar to that of the undivided state, the

comparison is valid.

Very shortly after the formation of the State in 1960-61, the economy of Madhya Pradesh represented a proportion of 5.6% of the economy of India as a whole. Four decades later, in 1998-99, the undivided Madhya Pradesh still represented a share of 5.6% of the economy of India. Table 1 indicates the changing share of the major states in the all-India economy over time.

The first observation on the undivided State of Madhya Pradesh is the relative constancy in the share of its economy in the national economy, right from its formation as a state till very close to its division.

More instructive is to look at the long term trend in per capita income of the states. Per capita income levels, while not taking into account intra-state individual differences in income levels, do represent a standardized measure of income. Just as in the eighties and nineties, the acronym BIMARU indicated a peer group of low income states with low levels of human development it is possible to identify a

peer group of states to which the State of Madhya Pradesh belonged in the early sixties, in terms of income levels. There was a group of states in 1960-61 with per capita incomes (at current prices) fairly close to each other. These were: Uttar Pradesh with Rs.253, Madhya Pradesh with Rs. 254, Andhra Pradesh Rs. 276 and Rajasthan Rs. 282. The all-India per capita income level then was Rs. 331. The per capita income of Madhya Pradesh as a proportion of all-India per capita income was about 75%.

In terms of per capita income, these peer group states of the sixties followed relatively different growth paths. As may be seen from Table 2, of these states, while the relative position of Madhya Pradesh remained stable in relation to national per capita income, Uttar Pradesh experienced a continuous relative decline vis-à-vis the all-India level over the next four decades, and even Rajasthan declined in the 1990s. Madhya Pradesh on the other hand registered a mild increase.

Table 3 indicates the relative ranking of states based on the relative indices of per capita income given in Table 2

Table 2: Index of Per Capita State Domestic Product (SDP) at Constant Prices, Three Year Averages

State	1960-63	1975-78	1990-93	1996-99

All India	100.00	100.00	100.00	100.00

NB: The indices indicate the proportion of the per capita income of these then less developed states to the national average (represented by index value of 100).

above, including other major states.

Taken over a long period, the ranking of Madhya Pradesh and Rajasthan indicated marginal changes, with Madhya Pradesh improving its inter-state position and Rajasthan slightly declining. The long term picture masks in the case of Rajasthan a surge in growth from about the mid-eighties onwards, which has enabled it to steadily improve its relative position since. It may be seen that notable declines in relative

all-India rankings have taken place in the major states of eastern India, most notably West Bengal, but also in the case of Bihar, Orissa and Assam.

To round off the picture of income growth, we take a look at the recent trends in growth of Gross State Domestic Product [GSDP] per capita between two periods in Table 4. It shows that while the state grew at moderate rates in the 1980s, the pace of growth accelerated in the 1990s.

Public policy has consistently attempted to reduce regional disparities and bring about balanced regional development. The long term trends seem to indicate that these efforts in

public policy at national level have not been particularly effective in reducing regional disparities.

Growth of all-India per capita income has accelerated in the eighties and nineties relative to earlier period, and growth rates of most of the states have risen, in inter-temporal terms. For example, in the case of Madhya Pradesh, negative growth rates of per capita incomes in the sixties and seventies have been replaced by growth rates in excess of 2% per annum in the nineties, but the all-India growth rate has shot up by more than proportionately from around 1% per annum in the sixties and seventies to nearly 5% per annum in the nineties. For all States, the range of growth rates has widened, and if this persists, then economic disparities between states will continue to widen.

COMPARATIVE PROFILE OF POVERTY

The Planning Commission has been estimating the incidence of poverty at National and State level using the methodology contained in the report of the Expert Group on Estimation of Proportion and Number of Poor (Lakdawala Committee) and

applying it to consumption expenditure data from the large sample surveys on consumer expenditure, conducted periodically by the National Sample Survey Organisation (NSSO). Official poverty estimates are accordingly available for the years 1973-74, 1977-78, 1983, 1987-88, 1993-94 and 1999-2000.

These official estimates may be considered to be the standard measure in mapping of State level poverty. Between two consecutive periods, there are often short-run fluctuations or variations in poverty estimates for particular States, which may not give a true picture of the overall trend, and may sometimes be due to changes in methodology. However, in considering this period as a whole, these variations tend to be ironed out and a better picture of the overall trend emerges. In the comparison of States, a long term trend of nearly three decades is available, if we consider the period from the first estimates for the years 1973-74, till the latest estimates in 1999-2000.

Since the analysis is with reference to Madhya Pradesh, we have taken for comparison estimates of six major states comparable in size to Madhya Pradesh and its basic characteristics. Further, with Madhya Pradesh being a largely rural state, we have taken the figures for rural poverty as a better comparison of the poverty profile. The estimates of six major comparative States for rural poverty are presented in the Table 5.

There are two schools of thought on the impact of economic growth on poverty reduction. One view is that growth per se has a poverty reducing impact, and accordingly one would expect to find poverty decline more rapidly in the faster growing States and less rapidly in the others. According to this view, only a substantial higher rate of growth can bring about the expansion in productive income earning opportunities needed to bring about a significant reduction in poverty.

The other view is that while economic growth has the potential to reduce poverty, equating growth with poverty reduction is too simplistic. Effective public policy interventions are needed for translating growth into reduction in poverty levels. These interventions should be such that they bring about improvements in physical and social infrastructure

Table 5: Percentage of People Below Poverty Line in Rural Areas

States/ UTs	Percentage of Persons 1973-74	Percentage of Persons 1977-78	Percentage of Persons 1983	Percentage of Persons 1987-88	Percentage of Persons 1993-94	Percentage of persons 1999-2000 (30 day recall)
Bihar	62.99	63.25	64.37	52.63	58.21	44.30
Orissa	67.28	72.38	67.53	57.64	49.72	48.01

Source: Planning Commission

leading both to expansion of social opportunities as well as more equitable access to productive assets. Otherwise, growth per se would not have a trickle down effect, and may instead, in all likelihood lead to worsening of inequalities.

In the long run trends of States, there does appear to be a positive linkage between growth and poverty reduction in the case of some States. Significant declines of between 33 and 40 percentage points in rural poverty as a whole have been recorded in the period in question by the faster growing states of Maharashtra, Tamil Nadu, Karnataka, Gujarat, Andhra Pradesh. In the case of MP, moderate growth has been accompanied by moderate declines in poverty over a long period. Both Bihar and Orissa have recorded relatively poor economic growth, and there seems to have been correspondingly little impact on poverty reduction.

HUMAN DEVELOPMENT ACROSS STATES

In the literature on the subject, human development is referred to as both the end and the means of development. Successive Five Year Plans have articulated human development concerns, though not necessarily in these words. The Eighth and Ninth Five Year Plans regarded human development as the ultimate goal of public action.

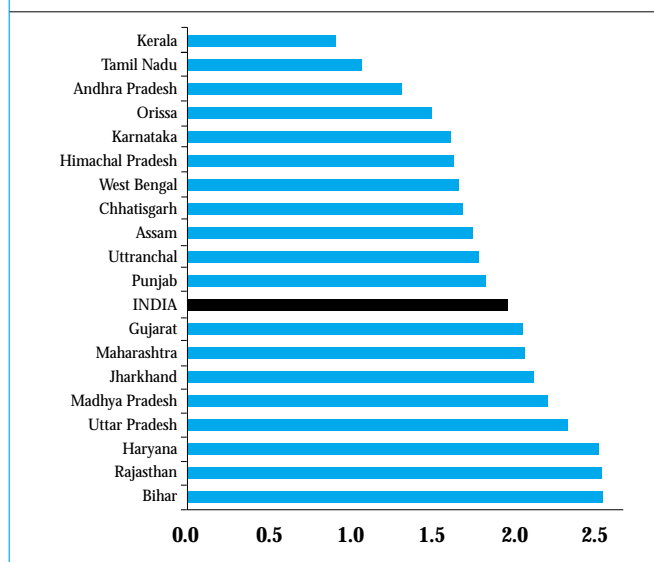

Madhya Pradesh was the first of the States with very low social indicators to articulate human development concerns and build it in as a cornerstone of state policy. The visible expression of these priorities was the bringing out of the Madhya Pradesh Human Development Report, 1995.

We now take a quick look at the profile of some States including Madhya Pradesh in two critical indicators of human development to see where they stand today. The first comparison is of the growth rates of population, for which the most recent data is provided by 2001 Census, and the other is infant mortality rate, which is available for the year 2000. Population growth is the net effect of natural growth (resulting from births and deaths) and net migration. For the larger States it is the natural growth which contributes mainly to population growth. In the Indian context, higher population growth rate for a State reflects demographic transition in which death rates have declined but birth rates have yet to decline commensurately.

While the state of Madhya Pradesh has a relatively high levels of population growth over the last decade, there has been a substantial decline in the decadal rate of growth over the previous decadal period, from 27 percent between 1981 and 1991 to 24 percent between 1991 and 2001, and this has been the lowest amongst the peer states, Uttar Pradesh, Rajasthan, Bihar. The high population growth rate has its own problems, especially for a poorer State, in terms of providing essential services and adequate opportunities for its people, and at current rates it would take more than a couple of decades for the population to stabilise.

In another critical indicator of human development, infant mortality rate is amongst the highest in India, and this

Growth of Population in States of India, 1991-2001

has remained so for the last many years. The low health indicator is attributable to many factors in the state. The nationally set norms for health services and health centres do not provide good access to health to people in this state with a population density much lower than national rates, a vast forest cover, and undulating terrain over most parts.

On the other hand, in education there has been remarkable progress in the state in the last seven to eight years. Over the last decade, the states literacy shot up from 45 percent to 64 percent, and female literacy from 29 percent to fifty percent. For the first time, the State has a literacy rate almost the same as the national average. There have also been other considerable achievements that have ensured universal access to elementary education, a very high, and near total enrolment that is sustained by high rates of retention. The significant improvements made by Madhya Pradesh in the last decade have been due to top priority assigned to proactive and innovative programmes for increasing literacy and enhancing access to education. The substantial achievement of the last decade in female literacy needs to be continued to take over the gaps that still remain.

The low level of human development in the State have in the past been one of the factors that have acted as a drag in the improvement in both economic growth performance as well as rural poverty reduction. With the recent developments, especially in education, and innovative programmes that focus around decentralisation on the one hand and a rights based framework on the other, the coming years would undoubtedly improve the levels of human development in Madhya Pradesh.

Finally in order to better understand the inter-State dimensions of progress, we look at the infrastructure

endowments of the States. Poor infrastructure has always been a handicap to growth. In the last decade, the importance of adequate infrastructure has been widely recognised and emphasised. Favourable infrastructure endowments are now seen as an important factor contributing to the attractiveness of the State for private investments.

Infrastructure is an area which backward States will never be able to address effectively without help from the Government of India. The fact remains that public policy at the National level has not responded effectively to the infrastructure inde, inspits of commitments shown in various Places and Finance Commission documents. Poor infrastructure has been impacting on the efforts to expand social opportunities as well avenues for increasing incomes and productivity.

The trends presented above indicate, in sum, that the State of Madhya Pradesh recorded rising but moderate levels of growth during the period of its existence as an undivided state, neither increasing nor decreasing its share in the national economy. The proportion of rural poverty in the state has declined. The goal of population stabilisation is a long way away. In terms of human development indicators, while significant progress has been made on the literacy front in the last decade, the overall relative position continues to bracket the state in the group of heartland states with relatively poorer indicators. Wide infrastructure differentials remain between Madhya Pradesh and most other states.

IMPLICATIONS FOR THE STATE

The reasons as to why the gap between the leading States and States like Madhya Pradesh is growing should be a concern for national policy. It would not be possible for the country as a whole to realise the high growth rates projected for the Tenth Plan and beyond unless the relatively lower growth rates in major States like MP are stepped up. The Approach Paper to the Tenth Plan expresses this in the following words “It is important to recognise that the sharp increase in the growth rate and improvement of social indicators that is being contemplated for the Tenth Plan is possible only if there is a significant improvement in the growth rates of the slow growing States. Indeed if the higher growth targets is sought to be achieved with a continuation of the low growth rates observed in some of the most populous States, it would necessarily imply a very large increase in inter-state inequality with serious consequences for regional balance and national harmony”.

Increasing the rate of growth of the economy of the state is thus not only an imperative for the State but also for the country as a whole. There is a need to focus on ways and means to increase the rates of growth of the State significantly, aiming perhaps at a rate double the current one.

While increased growth rate would by itself contribute to some extent to poverty reduction, as noted earlier, appropriate public policy initiatives for reduction in poverty by better land

and water management would help broad-base the benefits of growth. The State would also need to concentrate on both improving infrastructure and the levels of human development, since both are interlinked in terms of delivery of services as well as providing access to income earning opportunities. These areas prioritise themselves precisely because the State lags behind in these, and because these areas are amenable to public policy action.

However, public policy interventions need to be supported by adequate financial resources. These resources may be public or private. The aim should be for private investments to lead in the financing of the growth of economically productive activities in the State, whether in the industry, agriculture and services sectors. Industrial growth depends upon availability of infrastructure support in the form of power, transport, communications, while agricultural growth depends on rural infrastructure such as irrigation, rural electrification, rural roads. Public investments would need to be focused on human development, to expand opportunities for the people, and also on strengthening of infrastructure. These alone would make the state attractive for private investment flows, much more than any incentives that the government may provide.

Ideally, both Central and State sector public investments should be directed as much as possible to build economic and social infrastructure in poorly endowed and less developed States like Madhya Pradesh, to help remove constraints on growth and leverage private investments. The Eleventh Finance Commission noted that “States with good infrastructure are attracting private investments” and that “Central investments should be redirected taking this fact in view”.

THE FINANCIAL AND DEVELOPMENTAL CHALLENGE

Whether it is to step up public investment in critical social and economic infrastructure sectors, or to attract private

investment, it is necessary for the state to strengthen its fiscal position. The States fiscal position is affected both by generating more revenue as well as by managing expenditure better. Without embarking on a treatise on state finances, we present here a picture of the States finances, and compare them to performance with other states.

Before we do that, it is necessary to state two points. From 1992/93, the State Government had made the human development sectors a priority area for government action. This kind of focussed prioritisation had reduced emphasis on other sectors. This did force the State to decrease investments in infrastructure. Since 1998/99, with concerted action on social sectors taking off, emphasis towards physical build up of the state and reforms in key financial and infrastructures has now started.

Madhya Pradesh has a relatively low tax base with forty

percent of the states income accruing from agriculture, mining and forestry. This puts constraints to the tax potential in Madhya Pradesh. There is not enough buoyancy in the revenue collections. Compared to other states, the ratio of tax to SDP (a standardized measure of tax effort) is low, as can be seen from the comparison of the figures for 1998-99 in Graph.

It must also be recognised that the State has far more responsibility towards development than the centre, and the fiscal crisis of the 1990's led by the acceptance of recommendations of the Fifth Pay Commission has put the state in a dock. To overcome both the impact of the fiscal crisis, and the low tax base, the state had to resort to borrowings to cover its deficits. However, Madhya Pradesh has been a conservative borrower. Table 8 clearly shows the Debt to SDP ratio of Madhya Pradesh as being amongst the lowest in Indian states.

Table 8: Debt as percentage of State Domestic Product

State	1993-94	1994-95	1995-96	1996-97	1997-98	1998-99	1999-00 (B.E.)

Note : Absolute figures of Outstanding Debt include Internal Debt, Loans from Centre, Provident Funds, Insurance Funds and Reserve Funds and Deposits
 Source : Report of the Eleventh Finance Commission, Government of India

Further, the share of Madhya Pradesh in the total debt of Indian states has also been declining in the last seven to eight years. The growth rate of the share in the case of Madhya Pradesh has been -1.33 percent between 1993 and 2000, with its share dropping from 5.84 percent to 5.27 percent (see Table 9).

The states off-budget borrowings have also been low, and while most other states have resorted heavily to such borrowings, Madhya Pradesh has used this source only off late and that too in small measure. The need for investments in

infrastructure has led the state towards such borrowings, which include options such as bond roads.

In tackling the fiscal crisis, there has been some success in measures over the last six years. We have a case where the revenue deficit, the fiscal deficit and the primary deficit, all three have reduced. The Table 10 shows that since 1998/99 the revenue deficit has almost halved, and primary deficit has gone down even further.

The positive signs in reducing deficits have been helped greatly by a reduction on government bureaucracy over last

Table 10: Financial Parameters of Madhya Pradesh Government

Parameter	1998-99	1999-2000	2000-01	2001-02	2003-03

Per Capita Plan Outlay of States, 2000-01 (Rs.)

Source: Planning Commission

few years, which was enabled by a virtual stop to recruitment in many areas and reduced intake in others.

A considerable impact has also been of decentralisation. The initiatives and new programmes in education and health has greatly helped here. While teachers and other ground programme staff are now managed by panchayats, community managed programmes such as the Education Guarantee Scheme has reduced the salary burden of teachers, although their numbers have increased. Similarly, with panchayats and peoples collective managing many programmes, it has reduced the management burden on government staff, and also reduced basic costs of implementation. Decentralisation measures are also good for better fiscal management.

The other improvement has come from reforms in many sectors. User charges in many sectors are today pitted almost equal to if not above the economic rate of return. In the power

sector, which was one of the biggest draws on state exchequer, reforms in user charges have taken them to their economic rate of return and this has helped greatly in debt control.

These signs indicate that measures in fiscal control are making their effect today. If the current scenario continues we could expect some significant impact in the next 3-4 years. This will make available valuable resources need to raise rates of growth and sustainably improve human development indicators.

The prescriptions for tackling the financial position are well known. Many of these are already being implemented by the state to positive effect. The solutions targeting and reduction of direct and indirect subsidies, which include the levy of adequate user charges for economic services; reducing the drain on state finances due to mis-management of power sector entities and loss making public sector enterprises: modernisation of tax administration coupled with determination to realise revenues due to the state and downsizing of the state bureaucracy to affordable levels is an acknowledged imperative, and some of these steps are already being put in place. In Madhya Pradesh, as in many other states today, there needs clarity of purpose whether government exists for the public or it exists for the public servants.

What is to be appreciated is that these problems are not just "a fiscal problem" or something that relates to the Finance Department of the State Government. This is first and foremost a developmental challenge for the state. The resources available to a state like Madhya Pradesh, which started as one of the backward regions of the country cannot match those of the developed regions. It is here that the Planning Commission has failed poorer states in not addressing the growing inequality between states. Infact the outlays for the tenth plan in comparison to the ninth plan have in fact dropped for poorer States, and this would in all probability worsen the already widening disparities.

Technical Notes on the Human Development Index

The district level human development index for Madhya Pradesh¹ was first calculated in the Madhya Pradesh Human development Report 1995 and then subsequently in 1998. In both these years while some of the data remained the same, there was a shift in methodology as it evolved both in the UNDP international reports and in accordance with data availability at the district level.

The district wise human development index and the gender related development index in this report also changes both in the data it uses and the methodology. The districts HDIs in the three MP reports are therefore not strictly comparable.

1. HUMAN DEVELOPMENT INDEX

The Human Development Index is a composite index comprising of levels of human development in education, longevity or health, and in access to opportunities measured in per capita incomes, with the present status of districts in these parameters related with certain absolute achievement positions, or some desirable achievement positions. This index is a measure of how far a district has travelled, from a minimum level of achievement, and the path still to travel.

The index is calculated by the following formula:

$$\text{HDI}_{ij} (\text{Index}) = \frac{\text{Value}_{ij} - \text{Min}_j}{\text{Target}_j - \text{Min}_j}$$

HDI_{ij} = Index of deprivation for the i^{th} district for the j^{th} criterion.

Target j = This is the maximum achievable target for the j^{th} criterion (for example, it is 100 per cent for literacy).

Value ij = This is the value of the i^{th} district for the j^{th} criterion.

Min j = This is the minimum value for the j^{th} criterion (it is 0% for literacy)

The methodology is illustrated later, with an example of Betul district.

The criteria used for the district HDI and the methodology applied for the Madhya Pradesh Human Development Index (MPHDI) for districts are given below. It needs to be mentioned here that calculations for the indices and the data used for such calculations should not be used in isolation from the index. Much of the district data used is relevant in comparing districts and may not be a proper indicator in isolation to the index.

1.1 Education

UNDP uses adult literacy rate (literacy of population 15 years and above) as one of the two parameters. The other parameter used in enrolment of children aged 6-14 years. Data for literacy is now available for the year 2001 from the Census undertaken, but this literacy pertains to population aged six years and above and appropriate data for ages 15 years and above has still not been released by the Census. Taking literacy of ages six and above and enrolment rates of children aged six to fourteen leads to double counting of the educational attainment of the population aged six to fourteen as many children attending schools would also be literate. However, as we do not have data to calculate literacy for 15 years and above, we use the available data only.

Literacy rate for the population was calculated as percentage share of all literate in a district over the total population of people above 6 years of age in the district.

In the 1995 MPHDI, female literacy was given a weight greater than male literacy for the literacy index. However, this year since a separate Gender Development Index has also been calculated to assess the relative level of development of women vis-à-vis men, the literacy index used now does not give any extra weight to female literacy.

For the target maximum figure for the purpose of calculating the Index of Deprivation in literacy, we use 100 per cent this time, as against 80 percent used in 1995. The minimum rate is taken as 0 percent.

The second component of education is the combined school level enrolment. The figures for children enrolled in

¹ It pertained to the undivided state of Madhya Pradesh, which included the newly carved state of Chhattisgarh.

schools in 2000 have been provided by the Rajiv Gandhi Shiksha Mission, Government of Madhya Pradesh. These rates have been calculated from a state wide child to child, habitation to habitation survey of children under the Lok Sampark Abhiyan.

The enrolment figures in some cases have exceeded the estimated for population in age group 6-14 years. In such cases we have taken the enrolment rate to be 100 percent.

The target maximum for this enrolment has been taken at 100 percent, and the target maximum is 0 percent enrolment.

The two indices of literacy and school level enrolment were combined to get the Index of Deprivation for Education. The indices were combined in a weighted average, with 2/3 for literacy and 1/3 for all children in schools. A higher weight for literacy was taken to give importance to this most essential criterion and keeping in mind the problems of data in enrolment figures.

1.2 Health

Life Expectancy is the single criteria to assess the health status. In 1995, data for Life Expectancy was not available for all the districts and hence, Infant Mortality Rates were used for the year 1981 based on Census Fertility tables. Since then, Census has released Fertility tables for 1991 that permits us to arrive at indirect estimates for Life Expectancy at birth for districts. The indirect estimates for 1991 were arrived at using methodology applied by Census for calculating mortality tables for 1981². This is explained in detail later in this chapter. These estimates are subject to corrections, after final fertility tables are released, and Census publishes estimates for Life Expectancy based on this data, however these are not yet available to us. Census had released estimates for child mortality in 1991, but is yet to publish estimates for Expectancy of Life at the time of the publication of this report.

No data has been released from the 2001 census, which would help us in making estimations on either the Infant Mortality Rate or the Life Expectancy in the districts of Madhya Pradesh in 2001. However, we do have the life expectancy of the state as a whole and for its regions from National Sample Surveys Regional estimates. We used these regional estimates and the state level estimates to project district level life expectancies in the state from 1991 to the year 2001.

For the maximum target, a figure of 85 years was taken, and for the minimum value, figure of 25 years was applied to calculate the Health Development Index.

1.3 Income

The UNDP HDI uses 'adjusted per capita income for countries' to calculate the Index of Income. The State Government does not calculate district per capita incomes or district domestic product in Madhya Pradesh. Since it is extremely difficult to assess district domestic products directly, and thereby come to an assessment of per capita income, we have used district incomes derived from the net state domestic product (NSDP) for our use.

Data for calculating the district domestic product (DDP) is not available to enable a district – to – district calculation. The state domestic product is calculated under 16 categories by using sources from the State's own production and economic activities (such as, for agriculture, fisheries, forests, electricity etc). Estimation of the volume of products is done from different sources using centrally administered surveys by the Central Statistics Organisation (CSO), Annual Survey of Industries (ASI), etc. (for Railways, Industry, Unregistered Manufacturing, Gas, Water) and a mix of various sources. Unfortunately this is not available for districts, and we have to resort to other means to divide the SDP district wise, under the 16 major categories. Further, while the State Domestic Product is a sum of estimates in 16 different categories, many of these 16 are a sum of different components. Unfortunately, no information of the break up of the 16 categories into its sub-categories was available. This was a major constraint in arriving at estimates for relative strengths of districts in per capita incomes. The Department of Economics and Statistics has recently undertaken the task of preparing district income estimates, but the data is not yet ready³. This prevented us from more valid estimates for district and per capita incomes. However, the methodology adopted for arriving at district and per capita incomes is a "best possible" attempt by us, drawing on the methodology used by the Department of Economics and Statistics to arrive at State level figures, and applying it to the district level. The basic methodology suggested by CSO was also applied wherever possible.

A note of caution is necessary here. Calculating district level incomes is a difficult task given the lack of data at this level of dis-aggregation. What was needed for developing an index based on income was to get district level figures that would indicate the relative strength of districts in terms of per capita incomes drawn from estimates of share of districts to the state and NSDP. In the absence of such data across all the categories for the NSDP, the income index for the MPHDI relies on various surrogate measures. The income component

² The methodology has been taken from 'Indirect Estimates of Fertility and Mortality at the District Level, 1981, Occasional Paper No. 4 of 1994, Office of Registrar General of India.

³ The CSO has issued instructions to States to calculate their District Domestic Products, along with suggested methodology. The methodology is drawn from the successful experience of assessing District Domestic Products by the States such as Kerala, Uttar Pradesh, and Rajasthan for the past two decades. Madhya Pradesh Government has now undertaken this task.

for the MPHDI should in no way be taken as calculations for the district domestic product. The district shares of NSDP, and the per capita derived from these estimates are neither a substitute nor a surrogate for district domestic product and per capita incomes from it, but only a comparable figure for districts for this report.

The State NSDP is calculated under the 16 categories, using different methods for each category. Much of the calculations and adjustments are made on the basis of estimates and data from CSO and other studies, and applied to State level data, to arrive at State level estimates. For example, in unregistered manufacturing estimates of value added for unregistered manufacturing for five digit level of NIC is derived from the 1984-85 survey of directory manufacturing establishments (DME), non-directory establishments (NDE), and Own Account Enterprises (OAE). The Industry wise estimates are adjusted by moving them backwards and forwards for the current years estimates. Since district level figures for DME and NDE are not available separately and or under five-digit levels, we attempted to estimate district shares of unregistered manufacturing by using data on Establishments and Own account enterprises available district wise (rural and urban) from the provisional results of the Economic Census 1990 (though the results of the survey are not officially released we have used the data only for our estimates and data from the 1999 Economic Census has not been released for our use). Similarly, calculations for district shares are somewhat related to or correspond to, wherever possible, the methodology of the NSDP.

For some categories like agriculture, industry, mining, forestry, banking and public administration fairly good district level indicators were available that were used to distribute the domestic products of these categories along districts. Using different indicators, share of districts (in percentage) to the specific domestic product was estimated, and this share was applied to the domestic product of that category to arrive at district level domestic product for that category.

For other categories, we used data for employment, own account enterprises and establishments, etc. to arrive at district level shares.

The methodology used for the major categories is given below. In all, 95.31 per cent of the net state domestic product for 2000-2001 was allocated to districts on these lines. The share of the 16 categories of NSDP is given in what follows.

1. Agriculture (including Animal Husbandry)

Data was not available for agriculture, horticulture and animal husbandry separately. To estimate district shares of agriculture (including livestock production), district wise production of all major produce such as cereals, pulses, oilseeds was taken and states average prices for these were applied to get the district production in price for agriculture. The agriculture domestic product was then divided along districts according

to the share of each district to the total production (in price) in cereals, pulses and oilseeds.

2. Forestry and Logging

Incomes from Forestry and Logging were not used in 1995, due to lack of data. While there is no data available to estimate districts share in the domestic product of Forestry and Logging, we have used surrogates instead. Figures for area of districts under forests and forest revenue accruing to the State from forestry from the districts were used. The share of area under forests for every district to total area of State under forests was given two thirds weight and contribution of district to total revenue from forestry of the state was give one third weight. The combined weights arrived at were applied to forests contribution to State Domestic Product.

3. Fisheries

Data on district wise fish production, the value of fish, and other fishery related data was available from the fishery department, and the domestic product corresponds largely to these figures. Fisheries domestic product was allocated to districts accordingly.

4. Mining and Quarrying

Data on production and value of production as well as royalty and cess from all major and minor minerals in the state was available district wise. The share of each district to the total production value, and revenue from mining was taken and applied to the mining and quarrying domestic product of the state to arrive at district wise figures.

5. Manufacturing – Registered

In Small Scale Industries (SSI), we had data on district wise number of small units (SSI) and investments in them to date, and current employment. The Annual Survey of Industries gave district wise data on SSI units, employment, fixed investment and gross and net value added. For assessing contribution of SSI per district, we did a regression analysis between net value added (dependent variable) and units of SSI and fixed investment (independent variables). Using this equation, we arrived at an estimate of net value added by SSIs in each district for 1991-92, and the share of each district to this overall estimated SSI net value added was taken as the share of district SSIs to total SSIs contribution to the registered manufacturing domestic product.

Data was difficult for turnovers and outputs in the large and medium scale industries (LMI) sector. Available data gave us annual district wise large and medium scale industry investments, with current employment. We calculated the share of each district to LMI contribution to registered manufacturing domestic product by first adjusting the total LMI investment to the price levels of 1950-51, using the wholesale price index for industrial

products. This was used to measure the district wise investment in LMI. We estimated from field work, data available from surveys and regression analysis from available turnover and output data, the relative contribution of data of LMI units, employment and investment (adjusted) to total LMI sector. According to this estimate, LMI units was multiplied by a factor of 2, investment by 4 and employment by a factor of 1, and the weighted average of the total gave us a comparable column of data to calculate district wise shares of LMI. The share of each district in this table was taken to be the share of districts to LMIs share of registered manufacturing domestic product.

The SSI and LMI weighted share was taken together assigning a weight of 4 to LMI and 1 to SSI and share of districts to total states was applied to state domestic product in manufacturing – registered.

6. Manufacturing – Unregistered

For NSDP, unregistered manufacturing is calculated by using net value added from the 1984-85 survey on directly manufacturing establishments, non-directly establishments, and own account enterprises, which gives data for digit level under the NIC classification. District wise distribution of DME and NDE is not available and, data on establishments is not available below 1 digit NIC.

We took data for unregistered manufacturing from the Economic Census 1990 (provisional for Madhya Pradesh). The Economic Census gives district-wise number of own account enterprises (non-agriculture) and establishments in manufacturing. No data was available to get a share of OAE, and establishments to unregistered manufacturing. We added up the number of OAE to establishments for every district. The resultant sums were divided by the total number of OAE and establishments in the state, to get percentage shares for each district. These shares were assumed to correspond to district shares of the domestic product of manufacturing-unregistered. This share was applied to manufacturing unregistered domestic product to arrive at district shares.

7. Construction

In construction district level data was scarce, and wherever available was not consistent or available in all districts. In the absence of such figures we had to resort to the provisional data from the Economic Census 1990.

Taking figures of Own account enterprises in construction, they were added to the number of establishments in construction in each district. The sums were divided by the total number of OAE and establishments in construction in the state. The shares so arrived at were taken as its share in construction domestic product.

8. Electricity, Gas and Water

No satisfactory estimates could be developed due to absence of

disaggregated data especially for gas and water, and this category was thus left out.

9. Railways

No data was available to estimate district wise share in Railways. The state level estimates are provided directly by the Central Statistical Organisation, and there was no basis available with us to allocate state income from Railways to districts. Data on trains, railway lines and stations were not available for most districts, disabling us from making any kind of assessment.

10. Transport by Other Means and Storage

The assumption here is that the value of Transport and Storage should correspond to the vehicles and the revenue from transport from a district. The average of share of each districts total vehicles to all vehicles in the state and vehicles on roads to total vehicles on road in the state was taken, and combined in equal weight with the total revenue contributed by the district to total revenue from transport in the State. The share so arrived at was multiplied to contribution of Transport by Other Means and Storage to NSDP. This section was not assessed in 1995.

11. Communication

No data was available to satisfactorily assess district share in communications.

12. Trade, Hotels and Restaurants

Domestic product from Trade, Hotels and Restaurants was distributed amongst the districts on the basis of Establishments and Own Account Enterprises in each district in Wholesale Trade, Retail Trade and Hotels and Restaurants, according to the Economic Survey 1990.

13. Banking and Insurance

Banking and Insurance domestic product was divided on the share on each district on the deposits and loans in each district over the last five years.

14. Real Estate, Ownership of Dwellings and Business Service

No satisfactory data was available for this category.

15. Public Administration

This was based upon estimates of expenditure on Public Administration by the State Government, and strengths of the employment of state administration employees in each district, based on actual salaries given to permanent and temporary employees. Since there was a high positive correlation between the two, share of salaries of government employees to total salaries of government employees in Madhya Pradesh was used. This share was applied to contribution of Public Administration to NSDP to get estimates for districts.

16. Other Services

Figures for employment under other services were taken from the 1991 Census. The employment figures were divided by the total employment in other services in Madhya Pradesh to arrive at district shares and these shares were applied to domestic product from other services to arrive at district figures.

1.1.3.2 Adjusted Incomes

By themselves, the estimates for per capita incomes does not give an idea of the distortions in distribution or the levels of poverty in the districts, and the depth of deprivation of the poor. UNDP for their income component of the Human Development Index, used the Aitkinson's formula to adjust incomes, based upon marginal utility of incomes. This adjustment reduces the impact of very high incomes in some districts, and makes district more comparable to each other to assess relative levels of achievement in incomes. However, one problem with this method was that it discounted incomes above a threshold level (minimum level) quite drastically. The UNDP HDI, now uses a different method of adjusting poverty. The same method has been used to discount incomes for our district human development indices.

Income is discounted by using the following formula :

$$\text{Income Index} = \frac{\log y - \log y_{\min}}{\log y_{\max} - \log y_{\min}}$$

y: income of the district
 y_{\min} : Minimum income
 y_{\max} : Maximum target income

For a minimum income level and we calculated district wise poverty line by taking the poverty line developed by the Planning Commission based upon per capita monthly expenditure separately for rural and urban and adjusted to 1991-92 prices. To arrive at the district poverty line, we took a weighted average of rural and urban population with the adjusted rural and urban poverty line. The per capita incomes calculated for each district were divided by the resultant poverty line for each district, the product indicating the number of times district per capita was to the poverty line.

The three indices of development for health, education and income are then combined in a simple average to get the Human Development Index.

1.4 Calculation of HDI for Betul

Education

Index for literacy of Betul:

Target for literacy = 100.0 per cent

Minimum literacy = 0.0 per cent
 Literacy of Betul = 66.9 per cent

The calculation is:

$$\frac{66.9 \text{ (Literacy in Betul)} - 0.0 \text{ (Minimum Literacy)}}{100 \text{ (Target Literacy)} - 0.0 \text{ (Minimum Literacy)}}$$

Therefore, Index for Betul in literacy = 0.669

Similarly, the enrolment rate of children in Betul aged 6-14 years -

Index for Enrolment of Betul:

Target for Enrolment = 100.0 per cent
 Minimum Enrolment = 0.0 per cent
 Enrolment in Betul = 93.9 per cent

The calculation is:

$$\frac{66.9 \text{ (Enrolment in Betul)} - 0.0 \text{ (Minimum Enrolment)}}{100 \text{ (Target Enrolment)} - 0.0 \text{ (Minimum Enrolment)}}$$

Therefore, Index for Betul in Enrolment = 0.939

These two are combined with a weightage of 1/3rd to enrolment and 2/3rd to Literacy giving the Education Development Index-

$$(2/3) \times 0.669 + (1/3) \times 0.939 = 0.446 + 0.313 = 0.759$$

Health

Index for Life expectancy of Betul :

Target for Life expectancy = 85 years
 Minimum Life expectancy = 25 years
 Life expectancy in Betul = 54.7 years

The calculation is :

$$\frac{54.7 \text{ (Life Expectancy in Betul)} - 25.0 \text{ (Minimum Life expectancy)}}{85.0 \text{ (Target Life Expectancy)} - 25.0 \text{ (Minimum Life Expectancy)}}$$

Therefore, Index for Betul in literacy = 0.494

Income

Target for Maximum per capita income = Rs 35,705 (the per capita income of Delhi)

Minimum per capita income = Rs 4,933/- (the per capita income for the income based poverty line)

The per capita income estimated for Betul for 1999/2000 was Rs 10,035/-

$$\text{Income Index} = \frac{\log 10035 - \log 4933}{\log 35705 - \log 4933} = \frac{4.001 - 3.693}{4.553 - 3.693} = 0.359$$

- y: income of the district
- y_{min}: Minimum income
- y_{max}: Maximum target income

Human Development Index

Combining the three indices and taking their average we get

HDI of Betul (average of the three indices)
 = (0.759 + 0.494 + 0.359) = 0.537

2.0 Gender Development Index⁴

The Gender Related Development Index (GDI) uses the same variable as the HDI. The difference is that the GDI adjusts the average achievement of each district in life expectancy, education attainment and income in accordance with the degree of disparity in achievement between woman and man. It is based on the GDI developed by UNDP, used first in the Human Development Report in 1995.

For the gender sensitive adjustment, we use a weighting formula that express a moderate aversion to inequality, setting the weighting parameter ϵ equal to 2. This is the harmonic mean of the male and the female values.

The harmonic mean is calculated by taking the reciprocal of the population weighted arithmetic mean of the female and male achievement levels (which are themselves expressed in reciprocal form). Although this may sound complicated, the basic principle is straight forward. The harmonic mean will be less than the arithmetic mean to the degree that there is disparity between male and female achievement.

2.1 Educational Attainment

The variable for educational attainment is a composite index. It includes adult literacy, with a 2/3 weight, and gross combined primary, secondary and tertiary enrolment with a 1/3 weight. Each of these sub components is indexed separately. Both indices use a maximum value of 100 percent and a minimum value of 0 percent. The two indices are added together with the appropriate weights to form the composite index for educational attainment.

2.2 Longevity

The first step in the calculation of the GDI is to index the variable for life expectancy and education attainment. The estimates for life expectancy were calculated using Census of India 1991 fertility tables, as explained earlier in this chapter. Although the range for life expectancy is same for the women and men (60 years), the maximum and the minimum values are different. The value (or “fixed goal post”) for male life expectancy is 82.5 years and the minimum value is 22.5 years. For female life expectancy the maximum value is 87.5 years and the minimum 22.5 years. The values for women and men are indexed accordingly.

2.3 Income

The calculation of the index for the income is more involved. In calculating the female and male shares of earned income, we used two pieces of information: the ratio of the average female wage to the average male wage and the female and male percentage shares of the economically active population.

The ratio of the average female wage to the average male wage is not available for the state or the districts. The ratio is assumed to be the average ratio for the agricultural sector as well. The ratio of the female to the males was assumed to average to 67% based upon some recently conducted poverty assessment surveys.

The ratio is crude proxy for gender income differentials in paid work. These approximations for wages need to be improved and assessed for each district, but due to lack of proper information for all districts, the same ratio was applied across the State. Apart from possible under estimating the male-female wage differential, the figure of 67 percent also does not account for the fact that women were more as casual labour and as marginal workers, working for less than 183 days a year. Men on the other hand work primarily as main workers (gainfully employed for 183 days or more per year). The ratio of 67 % also does not account for income disparities based on non-labour resources, such as land and physical capital. However, in the absence of better data we use this figure.

The next step in calculating gender disparity in income uses available information on the percentage share of men and women in economically active population. Because of the lack of data on employment of gender, this procedure make simplifying assumption that female employment and male employment are proportional to female and male participation in labour force. We have two choices here : one is to take the workforce participation ratio (WPR), which includes main and marginal workers, and the second is to take only main workers, where the ratio of male to female main workers is very high. We choose to take main and marginal workers, for the sake of corresponding to the general WPR terms used to

⁴ This note has been taken from the Technical Notes describing the methodology for Gender Development Index from the Human Development Report – 1995, Technical Notes 1. Computing gender-equity-sensitive indicators, UNDP

assess participation of people in the workforce. From the ratio of female to male wages we can derive two ratio: the ratio of the female wage to the overall average wage and the ratio of the male wage.

These total ratio are derived from the following definition of the total wage bill (WL):

$$WL = W_f L_f + W_m L_m$$

where W is the average wage and L is the total labour force, and the f subscript denote female, and m subscript denotes male.

Dividing the equation through by $W_m L_m$, we can solve for W/W_m

$$W/W_m = (W_f/W_m) (L_f/L) + (W_m/W_m) (L_m/L)$$

we take the reciprocal of this result to solve for W_m/W . We can now also solve for W_f/W

$$W_f/W = (W_f/W_m) / (W/W_m)$$

a rough estimate of the female share of income can then be derived by multiplying the ratio of the of the average female wage to the overall average wage of the female share of the economically active population. The male share of the income can be calculated in the same way or by subtracting female share from 1.

The third step in estimating disparities in the income is to calculate the female and the male share of the population. The adjusted per capita incomes are then discounted on the basis of the gender disparity in proportional income share. In using adjusted per capita incomes, we are already taking in account the diminishing marginal importance for human development of the additional income above the average world per capita income. Up to this point, the methodology is the same as that used for the human development index.

The discounting for the gender disparity is calculated as follows. We form two proportional income shares by dividing the female and the male shares of income by the female and male shares of the population if there were gender equality, each proportional share would be equal to 1. We have apply the gender-equity-sensitive indicators (GESI) methodology of (1- ε) averaging - with equal to 2 in this case-to the two proportional income shares to derive the “equally distributed proportional income share”. The more gender inequality there is, the lower this ratio will be related to 1. We then multiply the adjusted per capita incomes by the equally distributed proportional income share to derive a measure of per capita income that, in effect, is now discounted for gender inequality. If there were no gender inequality, the ratio would be equal to 1 and per capita incomes would remain the same. As in the HDI, adjusted per capita income is proxy for access to basic resource necessary for human development. Finally, we index the adjusted per capita incomes for men and women with respect to maximum and minimum similar to those used in the HDI.

$$\text{Income Index} = \frac{\log y - \log y_{\min}}{\log y_{\max} - \log y_{\min}}$$

- y: Income of the district
- y_{\min} : Minimum income
- y_{\max} : Maximum target income

The equally adjusted income index is given by :
 [female population share x (adjusted female per capita)⁻¹ + male population share X (adjusted male per capita)⁻¹]⁻¹

The last step in the calculating the GDI is to add index for the income that we have just derived to the indices for life expectancy and the educational attainment and divide by 3. That gives each index a one third weight.

SECTORAL FACTSHEET

EDUCATION

Table ED1 highlights the districtwise number of literate and literacy rates for 2001. It also gives information on the gender ratio among the literate. The ratio of male to female literacy rate shows the relative deprivation of females in literacy rates to males.

LITERATE POPULATION

A person who can both read and write with understanding in any language is treated as literate. A person who can merely read but cannot write is not literate. It is not necessary that a person who is literate should have received any formal education or should have passed any minimum educational standard. All children of the age of 6 years or less are treated as illiterate even if they might be going to school and may have picked up reading and writing a few words.

LITERACY RATE

Literacy rate is calculated as the percentage of literate population over total population above the age of 7 years.

GENDER RATIO AMONG LITERATE

Gender ratio is the number of females in a population for every 1000 males. It is calculated by multiplying the female population in an area by 1000, and dividing this number by the male population in that area.

MALE/ FEMALE LITERACY RATE

It is the ratio of male to female literacy rates.

Share of India's Literate			
	Year	Madhya Pradesh	India
Share of India's Literate	2001		
Persons	5.6%		
Male	5.9%		
Female	5.3%		
Gender Ratio among Literates	2001	601	667
Literacy Rate	2001		
Persons		64.1%	65.38%
Male		76.80%	75.96%
Female		50.3%	54.28%
Male/ Female Literacy Rate	2001	1.53	1.39

**ED 2: LITERACY RATE BY SEX AND LOCATION IN DISTRICTS OF
MADHYA PRADESH, 1991-2001**

Table ED 2 gives the literacy rates for the districts of Madhya Pradesh as per the 1991 and 2001 census. The literacy rates are segregated into male/ female and rural/ urban categories.

LITERACY RATE

Literacy rate is calculated as a percentage of literate population over population above the age of 7 years.

Share of India's Literate			
	Year	Madhya Pradesh	India
Literacy Rate All	1991		
Persons		44.67	52.21
Male		58.54	64.13
Female		29.35	39.29
Literacy Rate Rural	1991		
Persons		35.53	44.69
Male		50.49	57.87
Female		19.17	30.62
Literacy Rate Urban	1991		
Persons		70.67	73.08
Male		80.98	81.09
Female		58.93	64.05
Literacy Rate All	2001		
Persons		64.11	65.38
Male		76.80	75.85
Female		50.28	54.16
Literacy Rate Rural	2001		
Persons		58.10	59.40
Male		72.10	71.40
Female		42.96	46.70
Literacy Rate Urban	2001		
Persons		79.67	80.30
Male		87.78	86.70
Female		70.62	73.10

ED 3: ELEMENTARY EDUCATION INFRASTRUCTURE AND ENROLMENT IN ELEMENTARY SCHOOL IN DISTRICTS OF MADHYA PRADESH, 2000

Table ED 3 gives information on the educational infrastructure and enrolment in districts of Madhya Pradesh. This includes the number of educational institutions and stage wise enrolment of boys and girls at primary level and middle levels. Total enrolment of boys and girls has also been calculated. Information is also given on the number of educational institutions per 10 square kilometers, to get an idea of the physical access of schools, and estimated population of children in the age group of 6-14 years to number of schools to indicate basic provision of educational institutions.

PRIMARY SCHOOL

Classes first to fifth constitute the primary school in Madhya Pradesh.

MIDDLE SCHOOL

Classes sixth to eighth constitute the middle school in Madhya Pradesh.

ELEMENTARY SCHOOL

Classes first to eighth constitute the elementary school in Madhya Pradesh.

ELEMENTARY INSTITUTIONS PER 10 sq. KM.

Gives an idea of the physical access to school and is calculated by dividing the total number of elementary institutions by the total geographical area and multiplying the quotient by 10.

CHILDREN PER INSTITUTION

Gives an idea of the basic provisioning of school and is obtained by dividing the total number of children enrolled in elementary school by the total number of elementary institutions.

Number of Institutions			
	Year	Madhya Pradesh	India
No. of Institutions	2000		
Primary School		1917	36495
Middle School		210	198004
Enrolment Boys	2000		
Primary School		6459172	64103289
Middle School		2259128	25082351
Enrolment Girls	2000		
Primary School		4996763	49509252
Middle School		1341093	16982847

SECTORAL FACTSHEET

EMPLOYMENT

Table EL 1 gives the total workers, main workers and marginal workers as per the 1991 and 2001 census. The growth in total workers and main workers between 1991 and 2001 is also presented in the table. The data on workers is segregated into male/ female categories. Information on Worker Participation Rate (WPR) for 1991 and 2001 is also given in the table along with the change in WPR for all areas. The WPR is segregated into male/ female and rural/ urban categories.

MAIN WORKERS

Census records a person as a Main Worker if he/she has worked for a major part of the year preceding the enumeration.

MARGINAL WORKERS

Census records a person as a marginal workers if he/ she has worked anytime at all in the year preceding the enumeration but has not worked for a major part of the year.

GROWTH IN WORKERS

This shows the change (growth or decline) in number of workers and is shown as the percentage increase in workers between 1991 and 2001 to total workers enumerated in the year 1991.

WORKER PARTICIPATION RATE/ RATIO (WPR)

This figure is the total number of main and marginal workers in an area to the total population residing in that area.

	Year	Madhya Pradesh	India
Workers			
Main Workers	2001	19077568	313173394
Marginal Workers	2001	6678917	89338796
Share of India			
MP Main Workers	6.1%		
MP Marginal Workers	7.5%		
WPR	2001	42.8%	39.3%
WPR Rural	2001	47.1%	42.0%
WPR Urban	2001	30.6%	32.2%
WPR Males	2001	51.6%	51.9%
WPR Females	2001	33.1%	25.7%

Census of India, 1991, 2001

TABLE EL 3: EMPLOYMENT INDICATORS IN DISTRICTS OF MADHYA PRADESH, 1991

Table EL 3 gives the percentage of main workers employed in primary, secondary and tertiary sector and the farm and non-farm sectors in 1991. Besides this the table also details the percentage main workers employed in different industrial categories.

PRIMARY SECTOR

Related with agriculture and allied activities and mining and quarrying.

SECONDARY SECTOR

Related with construction and all types of manufacturing activities.

TERTIARY SECTOR

Related with all types of services.

NON-FARM SECTOR

This is employment in all types of activities not based on farming and agriculture, and includes secondary sector, tertiary sector and mining and quarrying from the primary sector.

CLASSIFICATION OF WORKERS

Census classifies workers in nine industrial categories. These are explained below.

CULTIVATORS

For purpose of census a person is working as cultivator if he or she is engaged as employer, single worker or family worker in cultivation of land owned or held from government or held from private person or institutions for payment in money, kind or share. Cultivation includes agriculture operations for all produce except fruit growing, vegetable growing, or keeping of orchards or groves or working of plantations.

AGRICULTURE LABOURERS

Person working on another persons land for wages in money, kind or share are enumerated as agricultural labourers. An agricultural labourer has no risk in the cultivation and he has

no right of lease or contract on land on which he works.

LIVESTOCK, FORESTRY, FISHING, HUNTING, AND PLANTATION, ORCHARDS AND ALLIED ACTIVITIES

Worker involved in any of these activities and activities allied with agriculture but not concerned with agriculture operations.

HOUSEHOLD INDUSTRY (MANUFACTURING, PROCESSING, SERVICING AND REPAIRS IN HOUSEHOLD INDUSTRY)

Persons working in an industry located at home or within the village in rural areas and only within the precincts of the house where the household lives in urban areas.

OTHER CATEGORIES ARE SELF EXPLANATORY

Mining and Quarrying; Non household Industry; Construction; Trade and Commerce; Transport, Storage and Communications; Other Services.

	Year	Madhya Pradesh	India
Employment Share	1991		
Primary		75.4%	67.5%
Secondary		9.2%	12.0%
Tertiary		15.4%	20.5%
Non-Farm		25.4%	33.1%
As % of Main Workers	1991		
Cultivators		49.5%	38.7%
Agriculture Labourers		23.7%	26.1%

**EL 4 : NUMBERS AND PERCENTAGE OF TOTAL, MAIN, MARGINAL AND
NON-WORKERS BY RURAL AND URBAN AND MALE AND FEMALE IN DISTRICTS OF
MADHYA PRADESH, 2001**

Table EL 4 gives the numbers and percentages of total, main, marginal and non-workers for the year 2001. These are segregated by residence and sex.

MAIN WORKERS

Census records a person as a Main worker if he/ she has worked for a major part of the year preceding the enumeration.

MARGINAL WORKERS

Census records a person as a marginal worker if he/ she has worked anytime during the preceding year, but has not worked for a major part of the year.

NON-WORKERS

Persons who are not working as marginal or main workers.

NUMBERS (Nos)

The actual number enumerated in the census

PERCENTAGES

The percentage is taken as number of workers over the total population for that category

EL 5: SECTOR SHARE OF EMPLOYMENT OF MAIN AND MARGINAL WORKERS, 2001

Table EL 5 gives the number of workers and the sector share of employment of main and marginal workers in 2001. Cultivators per 100 hectare of cultivable land are also calculated in the table.

CULTIVATORS

For purpose of census a person is working as cultivator if he or she is engaged as employer, single worker or family worker in cultivation of land owned or held from government or held from private person or institutions for payment in money, kind or share. Cultivation includes agriculture operations for all produce except fruit growing, vegetable growing, or keeping orchards or groves or working of plantations.

AGRICULTURE LABOURERS

Person working on another persons land for wages in money, kind or share are enumerated as agricultural labourers. An agricultural labourer has no risk in the cultivation and he has no right of lease or contract on land on which he works.

HOUSEHOLD INDUSTRY (MANUFACTURING, PROCESSING, SERVICING AND REPAIRS IN HOUSEHOLD INDUSTRY)

Persons working in an industry located at home or within the village in rural areas and only within the precincts of the

house where the household lives in urban areas.

OTHER WORKERS

All other workers not classified in the above categories and who are working are classified here. These include manufacturing outside households, construction, all types of services etc.

CULTIVATORS PER 100 HECTARE OF CULTIVABLE LAND

Total number of cultivators in an area divided by the total cultivable land in that area in 100 hectares.

NUMBERS

The total number of workers in a particular employment classification.

PERCENTAGES

This denotes workers in this particular category divided by the total number of workers

EL 5: SECTOR SHARE OF EMPLOYMENT OF MAIN AND MARGINAL WORKERS, 2001

EL 6: LAND USE CLASSIFICATION IN DISTRICTS OF MADHYA PRADESH OVER 30 YEARS

EL 6 gives the land use classification in Madhya Pradesh in the years 1978-79, 1988-89 and 1998-99, with a breakup of the Total Geographical Area into Net Sown Area, Forest, Land not available for Cultivation, Other Uncultivated Land excluding Fallow Land, Cultivable Wasteland and Fallow Land. The above categories have further been divided into sub-groups. The Total Cropped Area, the Net Sown Area along with cropping intensity has also been given. The table also gives information on the percentage change in Net-Cropped Area and Gross Cropped over periods of ten years between 1978-79 to 1988-89 and between 1988-89 to 1998-99. Gross and Net Cropped Area as a percentage of Total Geographical Area are also calculated along with Area Sown more than once as a percentage of Net Sown Area.

GEOGRAPHICAL AREA

The latest figure of geographical area for the State/ Union Territory/ Districts furnished by the Office of the Surveyor General of India's data.

FORESTS

This includes all lands classed as forest under any legal enactment dealing with forests or administered as forests, whether state-owned or private, and whether wooded or maintained as potential forest land. The area of crops raised in the forest and grazing lands or areas open for grazing within the forests remain included under the forest area.

AREA UNDER NON-AGRICULTURAL USES

This includes all lands occupied by buildings, roads and railways or under water, e.g. rivers and canals and other lands put to uses other than agriculture.

BARREN AND UN-CULTURABLE LAND

This includes all barren and unculturable land like mountains, deserts, etc. Land which cannot be brought under cultivation except at an exorbitant cost, should be classed as unculturable whether such land is in isolated blocks or within cultivated holdings.

PERMANENT PASTURES AND OTHER GRAZING LANDS

This includes all grazing lands whether they are permanent pastures and meadows or not. Village common grazing land is included under this head.

LAND UNDER MISCELLANEOUS TREE CROPS, ETC.

This includes all cultivable land which is not included in 'Net area sown' but is put to some agricultural uses. Lands under Casurina trees, thatching grasses, bamboo bushes and other groves for fuel, etc. which are not included under 'Orchards' are classed under this category.

CULTURABLE WASTE LAND

This includes lands available for cultivation, whether not taken up for cultivation or taken up for cultivation once but not cultivated during the current year and the last five years or more in succession for one reason or other. Such lands may be either fallow or covered with shrubs and jungles, which are not put to any use. They may be assessed or unassessed and may lie in isolated blocks or within cultivated holdings. Land once cultivated but not cultivated for five years in succession is also included in this category at the end of the five years.

FALLOW LANDS OTHER THAN CURRENT FALLOW

This includes all lands which were taken up for cultivation but are temporarily out of cultivation for a period of not less than one year and not more than five years.

CURRENT FALLOW

This represents cropped area, which are kept fallow during the current year. For example, if any seeding area is not cropped against the same year it may be treated as current fallow.

NET AREA SOWN

This represents the total area sown with crops and orchards. Area sown more than once; in the same year is counted only once.

GROSS CROPPED AREA

This represents the total area covered with crops, i.e. the sum total of areas covered by all the individual crops; areas sown with crops more than once during the year being counted as separate areas for each crop.

AREA SOWN MORE THAN ONCE

This is obtained by deducting 'Net Area Sown' from 'Total Cropped Area'.

	Year	Madhya Pradesh	India
Geographical Area ('000 hectares)	1998-99	30745	306044
Share of India	10%	27.99	22.54
As percentage of geographical area			
Forests	1998-99	6	7.45
Area under non-agricultural uses	1998-99	4.38	6.39
Barren and unculturable land	1998-99	5.52	3.63
Permanent Pastures and Other Grazing Land	1998-99	0.06	1.18
Land under Miscellaneous Tree Crops	1998-99	3.82	4.56
Culturable Wasteland	1998-99	1.76	3.24
Current Fallow	1998-99	1.62	4.42
Net Area Sown as % of total geographical area	1998-99	48.84	46.59
Share of India	10.53%		
Gross Area Sown as % of total geographical area	1998-99	66.24	62.94
Share of India	10.57%		
Area sown more than once as percentage of net sown area	1998-99	17.41	35.08
Cropping Intensity	1998-99	135.4	135.1

EL 7: WASTELANDS IN MADHYA PRADESH, 2000- NRSA IMAGERY

Table EL 7 lays special focus on the wastelands classifying them into various sub-categories according to the National Remote Sensing Agency (NRSA) imagery 2000. The table gives comprehensive and reliable data on different categories of wastelands providing credible information for decision making.

WASTELANDS

It is described as degraded land which can be brought under vegetative cover with reasonable effort, and which is currently under utilised and land which is deteriorating due to lack of appropriate water and soil management or on account of natural causes. Wastelands can result from inherent/ imposed constraints such as, by location, environment, chemical and physical properties of the soil or financial or management constraints.

GULLIED/ RAVINOUS LAND

The gullies are formed as a result of localized surface runoff affecting the friable unconsolidated material in the formation of perceptible channels resulting in undulating terrain. The gullies are the first stage of excessive land dissection followed by the networking, which leads to the development of ravinous land. The word 'ravine' is usually associated not with an isolated gully but a network of deep gullies formed generally in thick alluvium and entering a nearby river, flowing much lower than the surrounding high grounds. The ravines, are extensive systems of gullies developed along river courses.

LAND WITH OR WITHOUT SCRUB

They occupy (relatively) higher topography like uplands or high grounds with or without scrub. These lands are generally prone to degradation or erosion. These exclude hilly and mountainous terrain.

WATERLOGGED/ MARSHY AREA

Waterlogged land is that land where the water is at or near the surface and water stands for most of the year. Such lands usually occupy topographically low-lying areas. It excludes lakes, ponds and tanks. Marshy land is that which is permanently or periodically inundated by water and is characterised by

vegetation, which includes grasses and weeds. Marshes are classified into salt/ brackish or fresh water depending on the salinity of water. These exclude Mangroves.

SALINE/ ALKALINE AREA

The salt affected land is generally characterised as the land that has adverse effect on the growth of most plants due to the action or presence of excess soluble or high exchangeable sodium. Alkaline land has an exchangeable sodium percentage (ESP) of about 15, which is generally considered as the limit between normal and alkali soils. The predominant salts are carbonates and bicarbonates of Sodium. Coastal saline soils may be with or without ingress or inundation by sea water.

SHIFTING CULTIVATION

It is the result of cyclic land use practice of felling of trees and burning of forest areas for growing crops. Such lands are also known as Jhum lands. This results in extensive loss of soil leading to land degradation.

DEGRADED NOTIFIED FOREST LAND

It is described as a forest where the vegetative (crown) density is less than 20 percent of the canopy cover. It is the result of both biotic and abiotic influences.

DEGRADED PASTURES/ GRAZING LAND

Pastureland is an area of land covered with natural grass along with other vegetation, often grown for fodder to feed cattle and other animals. Such lands are found in riverbeds, on uplands, hill slopes etc. Such lands can also be called as permanent pastures or meadows. Grazing lands are those where certain pockets of land are fenced for allowing cattle to graze. Overgrazing of these lands due to pressure of livestock and ruminants lead to their degradation.

SANDY AREA (INLAND AND COASTAL)

These are areas, which have stabilized accumulations of sand in-situ or transported in coastal riverine or inland (desert) areas. These occur either in the form of sand dunes, beaches, channel (river/stream) islands etc.

MINING/INDUSTRIAL WASTE

It is an area associated with Mining or Industry with excavated material or waste dumps or storage dumps of earthen material or industrial material. Such waste dumps are some times covered with or without vegetation.

BARREN ROCKY/ STONY WASTE/ SHEET ROCK AREA

It is defined as the rock exposures of varying lithology often barren and devoid of soil cover and vegetation and not suitable for cultivation. They occur amidst hill forests as openings or scattered as isolated exposures or loose fragments of boulders or as sheet rocks on plateau and plains. It includes quarry or gravel pit or brick kilns.

SNOW COVERED/ GLACIAL AREA

It is defined as a solid form of water consisting of minute particles of ice. It includes permanently snow covered areas.

	Year	Madhya Pradesh	India
Wastelands as percentage of geographical area	2000	19.31	20.17
Share of India	9.32%		
As percentage of total wastelands

EL 8: LAND OWNERSHIP BY SOCIAL CATEGORIES, AVERAGE LANDHOLDING SIZE, GINI COEFFICIENT OF OPERATIONAL HOLDINGS- 1990, 1995 AND TENANCY STATUS, 1990

Table EL 8 provides information on the ownership of land by social categories. The gini-coefficient of ownership of operational holdings for 1990-1991 and 1995-96 are critical indicator of the level of inequality in the districts, primarily in rural areas. The information on the tenancy status of operational holdings is from the agriculture and land settlement statistics. The table also gives the share of land held by the scheduled castes and the scheduled tribes. The table also shows trends in average landholding size since 1981 in 5 yearly intervals, thus giving a comparative picture. It also gives percentage decline in the holdings across a 15 year period from 1980-81 to 1995-96.

GINI CO-EFFICIENT OF LAND OWNING

Gini coefficient of land owning is a measure that shows how close the size distribution of land holdings is to absolute equality or inequality. Named for Corrado Gini, the Gini coefficient is a ratio of the area between the 45° line and the Lorenz curve and the area of the entire triangle. As the coefficient approaches zero, the size distribution of land holdings approaches absolute equality. Conversely, as the coefficient approaches one, the size distribution of landholdings approaches inequality.

EL 9: AREA, PRODUCTION, YIELD AND PER CAPITA AVAILABILITY OF FOOD GRAINS IN DISTRICTS OF MADHYA PRADESH OVER 30 YEARS

Table EL 9 gives the Area, Production, Yield and per capita availability of Cereals, Pulses, Food Grains and Oilseeds for the years 1978-79, 1988-89 and 1998-99. Area, Production and Yields for Kharif and Rabi Crops on the whole and the per capita production of Cereals, Pulses Food Grains and Oilseeds is given in the Table.

YIELD:

Yield of any crop group is obtained by dividing the production in kgs. by the area in hectares.

PER CAPITA PRODUCTION

Per capita production of any crop group is obtained by dividing the production in kgs. by the total population.

	Year	Madhya Pradesh	India
Cereals			
Area ('000 hectares)	1998-99	8537.2	106100
Production ('000 tonnes)		11933.5	188600
Share of India		6.33%	
Yield (kg/hectare)		1397.8	1778
Pulses			
Area	1998-99	4222.2	23500
Production		3374.9	14900
Share of India		22.65%	
Yield		799.3	634
Foodgrains			
Area	1998-99	12759.4	129600
Production		15308.4	203500
Share of India		7.52%	
Yield		1199.8	1571
Oilseeds			
Area	1998-99	5765.8	26200
Production		5440.9	24700
Share of India		22.03%	
Yield		943.7	944

EL 10: NET AND GROSS AREA IRRIGATED OVER 30 YEARS AND SOURCEWISE NET IRRIGATED AREA, 1998-99 IN DISTRICTS OF MADHYA PRADESH

EL 10 gives net and gross irrigated area in the years 1978-79, 1988-89 and 1998-99. It also gives the gross or net irrigated categorised based on source of irrigation in the same years. This gives us an idea about the source of water being used for irrigation.

NET IRRIGATED AREA

This represents the irrigated area by all the sources. Area irrigated more than once in the same year is counted only once.

GROSS IRRIGATED AREA

This represents the total area irrigated by all the sources, i.e. the sum total of irrigated areas covered by all the individual sources. Areas irrigated more than once during the year are counted separately.

AREA IRRIGATED MORE THAN ONCE

This is obtained by deducting 'Net Irrigated Area' from 'Gross Irrigated Area'.

	Year	Madhya Pradesh	India
Area irrigated by canals as % of net irrigated area (hectares)	1998-99	18.1%	31.10%
Area irrigated by tanks as % of net irrigated area (hectares)	1998-99	2.5%	5.16%
Area irrigated by wells as % of net irrigated area (hectares)	1998-99	44.2%	58.01%
Area irrigated by other sources as % of net irrigated area (hectares)	1998-99	35.1%	5.74%
% Net Irrigated area to net sown area (hectares)	1998-99	36.7%	40.0% (provisional)
% Gross irrigated area to gross area sown (hectares)	1998-99	27.8%	39.2% (provisional)

Source: Agriculture Statistics 2000, Directorate of Agriculture, Madhya Pradesh for M.P. and Land Statistics at a Glance, Directorate of Economics and Statistics, Department of Agriculture and Co-operation, Government of India for India.

Percentage of Irrigated Area by Source 1998-99: Madhya Pradesh and India

EL 11: LIVESTOCK POPULATION IN DISTRICTS OF MADHYA PRADESH, 1998-99

Table EL 11 gives the livestock population in terms of animals per capita, milch animals per capita and the draught animal per operational holding.

ANIMALS PER CAPITA

Animals per capita is obtained by dividing the total number of animals by the total population. Animals included here are cattle, buffalo, sheep, goat, horses and ponies, mules, donkeys, camel and pigs

MILCH ANIMALS PER CAPITA

Milch animals per capita is obtained by dividing the milch

animals which is the sum of cows and the female buffaloes by the total population.

DRAUGHT ANIMALS PER OPERATION HOLDING

Draught animals are animals which used for pulling load. Draught animals per operational holding are obtained by dividing the sum of bull, bullocks and male buffaloes by the number of operational holdings.

EL 12: CREDIT DEPOSIT RATIO, CREDIT FLOW TO AGRICULTURE AND RURAL CREDIT IN DISTRICTS OF MADHYA PRADESH

Table EL 12 gives rural credit scene in districts of Madhya Pradesh. Apart from presenting the number of bank branches in Madhya Pradesh including the Commercial Banks, Regional Rural Banks, District Central Co-operative Banks, District Land Development Banks and the number of rural bank branches, the details of priority sector lending including loans for agriculture, non-farm sector, small scale industries and other priority sectors are given in the table. Based on the deposits and advances in 1998-99 and 1999-2000, the credit deposit ratios for the respective years and the growth in credit deposit ratio between the two years are calculated.

POPULATION PER BRANCH

It shows the reach of bank branches and is calculated by dividing the total population by the total number of bank branches.

CREDIT DEPOSIT RATIO

It is the proportion of assets created by bank from the deposits received. The higher the ratio, the higher the loan assets created from deposit.

AGRICULTURAL CREDIT PER HECTARE OF GROSS CROPPED AREA

It is calculated as loans given out for agricultural purposes divided by the Gross Cropped Area in hectares.

AGRICULTURAL CREDIT PER HECTARE OF GROSS IRRIGATED AREA

It is calculated as loans given out for agricultural purposes divided by the Gross Irrigated Area in hectare.

	Year	Madhya Pradesh	India
CD Ratio	1998-99	58.97	55.48
	1999-2000	57.81	57.05

GENDER

Table GE 1 gives information on the Total Population, Population in the age group of 0-6 years and Population in 7+ age groups. Based on it the Overall Gender Ratio, Juvenile Sex Ratio and Sex Ratio in the 7+ age groups are presented. The districts are ranked on based on all the above. The changes in Overall Gender Ratio, Juvenile Sex Ratio, and Sex Ratio in 7+ age groups between 1991 and 2001 are also calculated and the districts ranked based on the above.

OVERALL GENDER RATIO

Overall Gender Ratio is the number of females in a population for every 1000 males. It is calculated by multiplying the female population in an area by 1000, and dividing this number by the male population in that area.

JUVENILE SEX RATIO

Juvenile Sex Ratio is the number of females in the age group of 0-6 years in a population for every 1000 males in the same age group. It is calculated by multiplying the female population in the age group of 0-6 years in an area by 1000, and dividing this number by the male population in the age group of 0-6 years in that area.

SEX RATIO IN 7+ AGE GROUP

Sex Ratio in the 7+ age group is the number of females in the age group of 7+ years in a population for every 1000 males in the same age group. It is calculated by multiplying the female population in the age group of 7+ years in an area by 1000, and dividing this number by the male population in the age group of 7+ years in that area.

CHANGE

Change in Gender Ratio between two points of time.

	Year	Madhya Pradesh	India
Overall Gender Ratio	2001	920	933
Juvenile Sex Ratio	2001	929	927
Sex Ratio in age group 7+ years	2001	905

GE 2: GENDER RATIO OVER 100 YEARS IN DISTRICTS OF MADHYA PRADESH

Table GE 2 gives information on the Gender Ratio in the districts of Madhya Pradesh in the last 10 decades and the changes in Gender Ratio between 1981-1991 and 1991-2001. The percentage change in Gender Ratio between 1991 and 2001 is also calculated. The table also ranks the districts based on their Gender Ratio in 2001.

GENDER RATIO

Gender ratio is the number of females in a population for every 1000 males. It is calculated by multiplying the female population in an area by 1000, and dividing this number by the male population in that area.

CHANGE

Change in gender ratio between two points of time

% CHANGE

The change in gender ratio between two points of time expressed as a percent of the gender ratio of the earlier time period

GE 3: MALE FEMALE DIFFERENTIALS IN HUMAN DEVELOPMENT IN DISTRICTS OF MADHYA PRADESH

Table GE 3 gives the indicators of literacy rates, infant mortality rates and life expectancy at birth segregated by sex and the gender ratio in order to present the male-female differential in human development.

GENDER RATIO

Gender ratio is the number of females in a population for every 1000 males. It is calculated by multiplying the female population in an area by 1000, and dividing this number by the male population in that area.

LITERACY RATE

Literacy rate is calculated as a percentage of the of literate population over population above the age of 7 years.

INFANT MORTALITY RATE

The annual number of deaths of infants less than one year of age per 1000 live births. More specifically, the probability of dying between birth and exactly one year of age times 1000.

LIFE EXPECTANCY (IN YEARS AT BIRTH)

Life expectancy is the number of years a newborn would live if the current mortality conditions (i.e. age-specific mortality rate) prevailed throughout its life.

	Year	Madhya Pradesh	India
Gender Ratio	2001	920	933
Literacy Rate	2001		
Male		76.80%	75.96%
Female		50.3%	54.28%
Infant Mortality Rate	1999		
Male		89.6	69.8
Female		89.5	70.8
Life Expectancy at Birth	1992-96		
Male		55.1	60.1
Female		54.7	61.4

GE 4: PARTICIPATION OF WOMEN IN ECONOMIC ACTIVITIES, 1991

Table GE 4 shows the Participation of Women in Economic Activities as per the 1991 and 2001 census. The Table shows percentage of Women Main Workers in all Main Workers and the share of Women Workers in each of the major categories of Cultivators, Agricultural Labourers, Workers in Household Industry and Other Workers.

WOMEN MAIN WORKERS SHARE OF ALL MAIN WORKERS

Census records a person as a Main worker if he/ she has worked for a major part of the year preceding the enumeration. Women main workers as share of all Main Workers gives the percentage of women main workers over all main workers.

WOMEN CULTIVATORS AS SHARE OF ALL CULTIVATORS

For purpose of census a person is working as cultivator if he or she is engaged as employer, single worker or family worker in cultivation of land owned or held from government or held from private person or institutions for payment in money, kind or share. Cultivation includes agriculture operations for all produce except fruit growing, vegetable growing, or keeping of orchards or groves or working of plantations. Women cultivators as share of all cultivators gives the percentage of women cultivators over all cultivators.

WOMEN AGRICULTURE LABOURERS AS SHARE OF ALL AGRICULTURE LABOURERS

Person working on another persons land for wages in money, kind or share are enumerated as agricultural labourers. An agricultural labourer has no risk in the cultivation and he has no right of lease or contract on land on which he works.

Women agricultural labourers as share of all agriculture labourers gives the percentage of women agricultural labourers over all agricultural labourers.

WOMEN WORKERS IN HOUSEHOLD INDUSTRY AS SHARE OF ALL WORKERS IN HOUSEHOLD INDUSTRY

(Manufacturing, Processing, Servicing and Repairs in Household Industry): Persons working in an industry located at home or within the village in rural areas and only within the precincts of the house where the household lives in urban areas. Women workers in household industry as share of all workers in household industry gives the percentage of women workers in household industry over all workers in household industry.

WOMEN OTHER WORKERS AS SHARE OF ALL OTHER WORKERS

Other categories include Mining and Quarrying, Non household Industry, Construction, Trade and Commerce, Transport, Storage and Communications, Other Services. Women workers in other categories as share of all workers in other categories gives the percentage of women worker in other categories over all workers in other categories.

SECTORAL FACTSHEET

GENERAL

Table GL 1 presents the demographic information on total population, sex ratio, decadal growth rate and population density for Indian States and Union Territories. The share of each states population in India is also presented in the table

SHARE OF NATIONAL POPULATION

This is taken as the percentage population of state or Union Territory over that of India.

SEX RATIO

This gives the number of females in population for thousand males. It is calculated by dividing the female population by male population and multiplying the quotient by 1000.

DECADAL GROWTH RATE

This is the growth of population in a decade and is calculated as a percentage of change in population to total population.

POPULATION DENSITY

Population density is obtained by dividing the population of the district by total geographical area in sq. kms.

GL 1: POPULATION, SEX RATIO, POPULATION DENSITY AND DECADAL GROWTH RATE OF POPULATION IN INDIAN STATES AND UNION TERRITORIES, 2001

1. The population of India includes the estimated population of entire Kachchh district, Morvi, Maliya-Miyana and Wankaner talukas of Rajkot district, Jodiya taluka of Jamnagar district of Gujarat State and entire Kinnaur district of Himachal Pradesh where population enumeration of Census of India 2001 could not be conducted due to natural calamities.
2. For working out the density of India and Jammu & Kashmir the entire area and population of those areas of Jammu & Kashmir which are under illegal occupation of Pakistan and China have not been taken into account.
3. While working out the decadal growth of population of Jammu and Kashmir the population figures for 1991 have been worked out by interpolation as 1991 Census could not be held in this State owing to disturbed conditions.

GL 1: POPULATION, SEX RATIO, POPULATION DENSITY AND DECADAL GROWTH RATE OF POPULATION IN INDIAN STATES AND UNION TERRITORIES, 2001

4. Figures shown against Himachal Pradesh have been arrived at after including the estimated figures of entire Kinnaur district of Himachal Pradesh where the population enumeration of Census of India 2001 could not be conducted due to natural calamity.

5. Figures shown against Gujarat have been arrived at after including the estimated figures of entire Kachchh district, Morvi, Maliya-Miyana and Wankaner talukas of Rajkot district, Jodiya taluka of Jamnagar district of Gujarat State where the population enumeration of Census of India 2001 could not be conducted due to natural calamity

6. Figures shown against geographical area of Jammu and Kashmir excludes 78114 sq. kms. under the illegal occupation of Pakistan and 5180 sq. kms. Illegally handed over by Pakistan to China and 37555 sq. Kms. under the illegal occupation of China in Ladakh district.

GL 2: POPULATION, LITERATE POPULATION AND LITERACY RATE IN INDIAN STATES AND UNION TERRITORIES, 2001

Table GL 2 presents the total population and population in the age group of 0-6 years in the year 2001 in the Indian States and Union Territories. It also gives information on the literate population and literacy rates for the year 2001. All the data have been segregated into male/ female categories

LITERATE

A person who can both read and write with understanding in any language is treated as literate. A person who can merely read but cannot write is not literate. It is not necessary that a person who is literate should have received any formal education or should have passed any minimum educational standard. All children of the age of 6 years or less are treated as

illiterate even if they might be going to school and may have picked up reading and writing a few words.

LITERACY RATE

Literacy rate is calculated as a percentage of literate population over population above the age of 7 years.

GL 3: POVERTY RATES, 1993-94

Table GL 3 provides with estimates of rural and urban poverty in the districts of Madhya Pradesh, drawn from regional estimates of poverty estimated by NSSO 1993-94. These derived estimates (*) are used in the construction of the Human Development Indices

POOR PERSON

A poor person is one whose consumption expenditure (PCTE) is below the acceptable minimum, called the poverty line.

HEAD COUNT RATIO

Head Count Ratio (HCR) is the proportion of poor people in the total population.

Population below Poverty Line: 1999-2000		
	Madhya Pradesh	India
Rural	37.06%	27.09%
Urban	38.44%	23.62%
Combined	37.43%	26.10%

* Data for state and regional level poverty from the National Sample Surveys undertaken in 1993/94 are available for sub-state regions, according to agro-climatic zones (for five zones for Madhya Pradesh). The rural and urban poverty rates are available for the entire region as a whole, divided into rural and urban. To get estimates of rural and urban poverty in each of the districts within an agro-climatic zone, estimated rural and urban population in 1993/94 was calculated. The value of agriculture and forest output for the districts in each zone was divided by the total agriculture and forest output for the zone as a whole for that period. The quotient was divided by share of the estimated rural population of the district to the estimated rural population for the zone as a whole. The poverty rate (head count ratio) for rural poverty for the entire zone was divided by the resultant quotient and the resultant figure was assumed to represent the rural poverty rate for each district within a zone.

For urban poverty, no single income measure was found significant enough, and we found that zonal urban poverty rates are sensitive to data on households without access to safe drinking water, electricity and toilet. Similar to the calculation for rural poverty, we took the population in each district without access to all three facilities in the Census in 1991, and, the share of this population to the total such people in an entire zone. Similarly, the share of the estimated urban population in each district was divided by the total estimated urban population for each zone. The quotient from the first was divided by the quotient from the second, and the result was multiplied with the NSS urban poverty rate (head count ratio). The total poverty ratio was calculated from the weights of rural and urban poverty in each district.

GL 4: POPULATION DISTRIBUTION, DECADAL GROWTH RATE, SEX RATIO AND DENSITY BY DISTRICT, 2001

Table GL 4 gives demographic data in the districts of Madhya Pradesh. Taking data from the 1991 and 2001 census, this table gives population in the districts. The data on population is segregated into male-female and rural-urban categories. This table also gives the district wise decadal growth rates in the last two decades as well the gender ratios and density of population.

SHARE OF STATE POPULATION

This is taken as the percentage population of the district over that of Madhya Pradesh.

DECADAL GROWTH RATE

This is the urban growth of population in a decade and is calculated by dividing the change in population by total population and multiplying the quotient by 100.

POPULATION DENSITY

Population density is obtained by dividing the population of the district by total geographical area in sq. kms.

SEX RATIO

This gives the number of female in population for thousand males. It is calculated by dividing the female population by

male population and multiplying the quotient by 1000.

URBAN AREA

An urban area is defined as follow:

- a) All places with a Municipality Corporations, Cantonment, Board or Notified Town Area etc.
- b) All other places which satisfy the following criterion:
 - i) A minimum population of 5000
 - ii) Atleast 75% of the male working population engaged in non-agricultural pursuits
 - iii) Density of population of atleast 400 per sq. km. (or 1000 per sq. miles)

RATE OF URBANISATION

This is calculated by dividing the urban population by the total population and multiplying the quotient by 100.

Population below Poverty Line: 1999-2000			
	Year	Madhya Pradesh	India
Share of India's Population	2001		
Total		5.9%

GL 5: PERCENTAGE DECADAL VARIATION IN POPULATION OVER 100 YEARS

Table GL 5 gives the districtwise percentage decadal variation in population over the last 10 decades and the change in decadal growth rate between 1981-91 and 1991-2001. The table also ranks the districts based on decadal growth rate between 1981-1991 and 1991-2001 and the change in decadal growth rate between 1981-1991 and 1991-2001

DECADAL GROWTH RATE

This is the growth of population in a decade and is calculated by dividing the change in population by total population and multiplying the quotient by 100.

CHANGE IN DECADAL GROWTH RATE

This shows the change (growth or decline) in the decadal growth rate between the decades 1981-1991 and 1991-2001

Decadal Growth Rate		
Year	Madhya Pradesh	India
1981-1991	27.24	23.86
1991-2001	24.34	21.34

GL 6: DISTRICTWISE INFORMATION ON GEOGRAPHICAL AREA, TOWNS, VILLAGES AND ADMINISTRATIVE SETUP

Table GL 6 gives information on the geographical area of the districts of Madhya Pradesh. It also presents information on the number of towns and villages in each of the district as well as the administrative setup including the number of tehsils, blocks, Janpad Panchayats and Gram Panchayats.

TOWNS

A town is defined as all places within a municipality, corporation, cantonment, board or notified town area committee, etc. and all other places which satisfy the following criteria

- i) a minimum population of 5000
- ii) atleast 75% of male working population engaged in non agricultural pursuits
- iii) a density of population of atleast 400 persons per square km.

- i) a population of less than 5000
- ii) atleast 75% of the male working population engaged in agricultural pursuits
- iii) a density of persons less than 400 persons per sq. km.

GRAM PANCHAYAT:

For the purpose of the Madhya Pradesh Panchayat Raj Adhiniyam, 1993, a Gram Panchayat is constituted for a village under sub-section (1) of Section 10.

VILLAGE:

A village consists of a habitation or a group of habitations or a hamlet or a group of hamlets comprising a community and managing its affair in accordance with tradition and customs.

A village must satisfy the following criteria

JANPAD PANCHAYAT

For the purpose of the Madhya Pradesh Panchayat Raj Adhiniyam, 1993 a Janpad Panchayat is constituted for a Block under sub-section (2) of section 10.

GL 7: ROAD NETWORK IN DISTRICTS OF MADHYA PRADESH, 1999

Table GL 7 gives information on the road infrastructure in Madhya Pradesh. The table presents available data on the length of national highways, state highways, district main roads and rural roads. It also gives data on the pucca and kutcha roads. Rural connectivity is shown by rural road length per village and percentage of villages not connected with pucca roads.

NATIONAL HIGHWAYS

These are main highways running through the length and breadth of the country, connecting to major ports, foreign highways and capitals of States/ Union territories and large industrial and tourist centres, and including roads required for strategic movements for the defence of the country.

STATE HIGHWAYS

These are arterial roads of a State linking district headquarters and important cities within the State and connecting them with National Highways or Highways of the neighbouring States.

DISTRICT MAIN ROADS

These are important roads within a district, serving areas of production and markets and connecting these with each other or with the main Highways.

VILLAGE ROADS

These are roads connecting villages/habitation or groups of habitations with each other and to the nearest road of a higher category.

GL 9: TELECOM CONNECTIONS (DOT) IN DISTRICTS OF MADHYA PRADESH, 2000

Table GL 9 presents data on the total number of exchanges, urban and rural exchanges and the number of telephone connections in each district. The physical access to telephones is shown by calculating the number of telephone connections per 100 population.

SECTORAL FACTSHEET

HABITAT

Table HA 1 gives the districtwise data on the forest cover and forest types of Madhya Pradesh comparing the situation in 1999 with that in 1993, 1995 and 1997. The data on forest cover to total area and per capita forest area is also presented in the table.

DENSE FOREST

All forests with tree cover of canopy density of 40 percent and above.

OPEN FOREST

All forests with tree cover of canopy density between 10 to 40 percent.

SCRUB FOREST

All lands with poor tree growth mainly of small or stunted trees having canopy density less than 10 percent

FOREST COVER TO TOTAL AREA

This gives the percentage of forest cover to the total geographical area.

CHANGE COMPARED TO 1997

This gives the change (growth or decline) in forest area in 1997 as compared to 1997.

PER CAPITA FOREST AREA

Per capita forest area is obtained by dividing the total forest area in hectares by the total population.

	Year	Madhya Pradesh	India
Dense Forest as percentage of geographical area	1999	13.6%	11.48%
Dense Forest- Share of India	21.6%		
Open Forest as percentage of geographical area	1999	10.7%	7.76%
Open Forest- Share of India	19.7%		
Mangrove Forest	1999	0%	.15%
Mangrove Forest- Share of India	0%		
Total Forest as percentage of geographical area	1999	24.4%	19.39%
Total Forest- Share of India	20.7%		

Source: Forest Survey of India, 1999

*: The methodology of the survey: IRS 1C/1D satellites of India, with a resolution of 23.5m, fed data on 11 states crucial to forestry studies; the rest were scanned by IRS 1B with a resolution 36m. And data on 13 key states were interpreted digitally. But conclusions were not reached merely on the basis of remote sensing data. FSI carried out extensive field trips for 'ground truthing', to confirm the accuracy of interpretation.

HA 2: SELECTED INFORMATION ON URBAN SLUMS AND TOWNS IN MADHYA PRADESH

Table HA 2 provides information on the extent of slums in the urban areas in terms of population and as percentage of urban population. The table also gives information on the other demographic indicators and social indicators in the slums like population in the age group of 0-6 years, overall sex ratio, juvenile sex ratio and the literacy rates both male and female in slum areas.

SLUMS

For the purpose of Census of India, 2001, the slum areas broadly constitute of:

- 1) All specified areas notified as 'Slum' by State/Local Government and UT Administration under any Act;
- 2) All areas recognized as 'Slum' by State/Local Government and UT Administration which may have not been formally notified as slum under any Act;
- 3) A compact area of at least 300 population or about 60-70 households of poorly built congested tenements, in unhygienic environment usually with inadequate infrastructure and lacking in proper sanitary and drinking water facilities.

GENDER RATIO

This gives the number of females in population for thousand males. It is calculated by dividing the female population by male population and multiplying the quotient by 1000.

JUVENILE SEX RATIO

This gives the number of females in population for thousand males in the age group of 0-6 years. It is calculated by dividing the female population in 0-6 years of age by male population in the same age group and multiplying the quotient by 1000.

LITERACY RATES

Literacy rate is calculated as the percentage of literate population over population above the age of 7 years.

	Year	Madhya Pradesh	India
Slum Population as percentage of Urban Population	2001	24.31	14.1
Gender Ratio in Slum Areas	2001	904	875
Juvenile Sex Ratio in Slum Area	2001	903	918
Literacy Rate in Slum Areas	2001		
Persons		75.7	73.7
Male		84.7	81.4
Female		65.7	65.0

Table HA 3 gives information on extent of institutional provision of safe drinking water to villages. The table presents data from the Public Health Engineering Department of the government of Madhya Pradesh for villages covered with handpump for water.

SAFE DRINKING WATER

If the household has access to drinking water supplies from a tap, handpump or tubewell situated within or outside the premises, it is considered as having access to safe drinking water.

FULLY COVERED

The habitations where the norms of atleast 40 litres of safe drinking water per capita per day (lpcd) are fulfilled are said to be fully covered.

SHARE OF HABITATIONS FULLY COVERED

The percentage of habitations fully covered to the total habitations.

PARTIALLY COVERED

The habitations where some safe drinking water is provided

but is less than 40 litres per capita per day are said to be partially covered. Partially covered habitations may fall in two categories, those getting 10-40 litres per capita per day and those getting even less than 10 litres per capita day.

SHARE OF HABITATIONS PARTIALLY COVERED

It is the percentage of habitations partially covered to the total habitations.

NOT COVERED

The habitations, which do not have access to safe drinking water at all, are said to be not covered.

SHARE OF HABITATIONS NOT COVERED

It is the percentage of habitations not covered to the total habitations.

SECTORAL FACTSHEET

HEALTH

Table HE 1 gives details on Health Infrastructure available in the district such as Community Health Centres (CHC), Primary Health Centres (PHC), Sub Health Centre (SHC), District Hospitals, Urban Civil Hospitals, Post Partum Centres etc. The Table gives population per health centre, rural population per SHC and PHC and the average area in sq. kms. serviced per health institution in order to indicate the basic provisioning of these.

SUB HEALTH CENTRE (SHC)

Each sub health centre caters to approximately 4-5 villages. They provide basic health care, maternal and child health services including family planning. They also undertake simple sanitation and health education tasks.

PRIMARY HEALTH CENTRE (PHC)

Each Primary Health Centre supervises six sub-health Centres. PHCs supervise community health outreach work and offer general medical and simple surgical services.

COMMUNITY HEALTH CENTRE (CHC)

The concept of Community Health Centre was introduced in 1985. CHCs serve upto 100 000 people and provide specialist medical, paediatric, obstetric and surgical services.

DISTRICT HOSPITALS

The District Hospital provides specialist medical, paediatric, obstetric and surgical services on a large scale. Other specialities are also included as required from time to time.

POPULATION PER HEALTH INSTITUTION

This indicates the basic provisioning of health institutions and is calculated by dividing the total population by the total number of health institutions. Health institutions here includes district hospitals, urban civil hospitals, community health centres, PHCs and SHCs.

RURAL POPULATION SERVED PER PHC

This indicates the basic provisioning of health centres in rural areas and is calculated by dividing the rural population by the number of PHCs.

RURAL POPULATION PER SHC

This indicates the basic provisioning of health centres in rural areas and is calculated by dividing the rural population by the number of SHCs.

AVERAGE AREA SERVICED PER HEALTH INSTITUTION

This indicates the physical accessibility of health institutions and is obtained by dividing the total geographical area by the number of health institutions.

	Year	Madhya Pradesh	India
Population covered per Primary Health Centres*	1996	30084	27364
Population covered per Sub Health Centres*	1996	4256	4579
Population covered per Community Health Centres (in 000)*	1996	149	214

HE 2: LIFE EXPECTANCY AND MORTALITY RATES

Table HE 2 presents indirect estimates for Infant Mortality Rate, Child Mortality, Life Expectancy at age 0 for different sections of the populations for 1991, and some comparative figures for 1981. These estimates are based on fertility data on total number of children born and surviving of every married woman, given by the census. Based on these data, IMR is calculated using Pearson's method suggested by Census of India. Mortpak Lite, a United Nations Programme for demography, was used extensively for these figures. While the estimate for Infant Mortality match well with the 1991 Sample Registration Scheme (SRS) estimates, they are subject to modification due to need to smoothen the population table. Thus the estimate may get modified, but for the purpose of comparative analysis, and a fairly accurate picture of the status of longevity, the figures are very useful and suffice well. The estimates are also provided for rural and urban and male and female. Estimates of male and female life expectancy were also calculated using the widow techniques. However, the result did not compare well with SRS estimates and hence were dropped.

LIFE EXPECTANCY

Life Expectancy (in years at birth): Life expectancy is the number of years a newborn would live if the current mortality conditions (i.e. age-specific mortality rate) prevailed throughout its life.

INFANT MORTALITY RATE (IMR)

Infant Mortality Rate: Infant Mortality Rate is the number of deaths of infants less than one year of age per thousand live

births. It is calculated by dividing the number of infant deaths during the year by number of live births during the year and multiplying the quotient by 1000.

CHILD MORTALITY RATE (AGES 1-5)

Child Mortality Rate (ages 1-5) is the number of deaths among children aged 1-5 years per 1000 children in the same age group.

	Year	Madhya Pradesh	India
Life Expectancy at birth Total	1992-96

**These estimates are provisionally calculated by the MPHRO office based on Fertility Tables of 1991 Census.

HE 3: SELECT HEALTH INDICATORS

Table HE 3 presents the Key Health Indicators like percentage of girls marrying below 18 years of age, Couple Protection Rate (CPR), Unmet needs, percentage pregnant women with ANC, percentage pregnant women with full ANC, percentage institutional deliveries and percentage safe deliveries as found out from the district level household survey carried out as part of Reproductive Child and Health Project by the Government of India. Data for percentage children immunised, percentage safe deliveries and percentage couple protection rate are also presented from other sources.

PERCENTAGE CHILDREN IMMUNISED

Percentage children immunised is obtained by dividing the number of children fully immunised by the total number of children in the age group of 12-23 months and multiplying the quotient by 100.

PERCENTAGE SAFE DELIVERIES

Percentage safe deliveries is calculated by dividing the number of deliveries under proper hygienic conditions under the supervision of trained health professionals by the total number of deliveries and multiplying the quotient by 100.

PERCENTAGE COUPLE PROTECTION RATE

Percentage couple protection rate is obtained by dividing the number of couple adopting family planning techniques by the total number of eligible couple and multiplying the quotient by 100.

PERCENTAGE OF GIRLS MARRYING BELOW 18 YEARS OF AGE

It is calculated by dividing the number of girls married below

the age of 18 years, the legal age for marriage of girls by the total population of girls upto 18 years of age and multiplying the quotient by 100.

PERCENTAGE PREGNANT WOMEN WITH ANTI NATAL CARE (ANC)

This is obtained by dividing the percentage of pregnant women who received at least some of the ANC services divided by the total number of pregnant women in the same period and multiplying the quotient by 100. The complete ANC package consisting of 3 ANC checkups by a visiting doctor or a health professional in a medical facility, or receiving a home visit from a health worker or both, intake of required dose of IFA tablets and 2 tetanus toxoid injections.

PERCENTAGE PREGNANT WOMEN WITH COMPLETE ANTI NATAL CARE (ANC)

This is obtained by dividing the percentage of pregnant women who received the full package of ANC services divided by the total number of pregnant women in the same period and multiplying the quotient by 100. The complete ANC package consisting of 3 ANC checkups by a visiting doctor or a health professional in a medical facility, or receiving a home visit from a health worker or both, intake of required dose of IFA tablets and 2 tetanus toxoid injections.

PERCENTAGE INSTITUTIONAL DELIVERIES

Percentage Institutional Deliveries is calculated by dividing the total number of births that took place in health facilities to the total number of births in that same period and multiplying the quotient by 100.

	Year	Madhya Pradesh	India
% Fully Immunised Children aged 12-23 months	1998-99	22.4	42.0
% Couple Protection Rate	1998-99	48.59	48.2
% Births Delivered in Medical institutions	1998-99	33.6	20.4
