NTRODUCTION

The 2019-20 National Family Health Survey (NFHS-5), the fifth in the NFHS series, provides information on population, health, and nutrition for India and each state and union territory. Like NFHS-4, NFHS-5 also provides district-level estimates for many important indicators. All five NFHS surveys have been conducted under the stewardship of the Ministry of Health and Family Welfare (MoHFW), Government of India. MoHFW designated the International Institute for Population Sciences (IIPS), Mumbai, as the nodal agency for the surveys. Funding for NFHS-5 was provided by the Government of India. Technical assistance and additional funding for NFHS-5 was provided by the USAID-supported Demographic and Health Surveys Program, ICF, USA. Assistance for some of the Clinical, Anthropometric, and Biochemical (CAB) tests was provided by the ICMR and the National AIDS Research Institute (NARI), Pune.

Four survey questionnaires – household, woman's, man's, and biomarker-were used to collect information in 19 languages using Computer Assisted Personal Interviewing (CAPI). All women age 15-49 and men age 15-54 in the selected sample households were eligible for interviewing. In the household questionnaire, basic information was collected on all usual members of the household and visitors who stayed in the household the previous night, as well as socioeconomic characteristics of the household, water and sanitation, health insurance, and number of deaths in the household in the three years preceding the survey. Two versions of the woman's questionnaire were used in NFHS-5. The first version (district module), which collected information on women's characteristics, marriage, fertility, contraception, reproductive health, children's immunizations, treatment of childhood illnesses, and nutrition was fielded in the entire sample of NFHS-5 households. Information on these topics is available at the district, state, and national levels. In the second version of the questionnaire (state module), four additional topics, namely, sexual behaviour, HIV/AIDS, husband's background and women's work, and domestic violence, were also included. This version was fielded in a subsample of NFHS-5 households designed to provide information only at the state and national levels. The man's questionnaire covered the man's characteristics, marriage, number of children, contraception, fertility preferences, nutrition, sexual behaviour, attitudes towards gender roles, HIV/AIDS, and lifestyle. The biomarker questionnaire covered measurements of height, weight, and haemoglobin levels for children; height, weight, waist and hip circumference, haemoglobin levels, and finger-stick blood for additional CAB testing in a laboratory for women age 15-49 and men age 15-54; and blood pressure and random blood glucose for women and men age 15 years and over. Questionnaire information and biomarkers were collected only with informed consent from the respondents.

The NFHS-5 sample was designed to provide estimates of all key indicators at the national and state levels, as well as estimates for most key indicators at the district level (for all 707 districts in India, as on 31 March 2017). The total sample size of approximately 610,000 households for India was based on the size needed to produce reliable indicator estimates for each district. The rural sample was selected through a two-stage sample design with villages as the Primary Sampling Units (PSUs) at the first stage (selected with probability proportional to size), followed by a random selection of 22 households in each PSU at the second stage. In urban areas, there was also a two-stage sample design with Census Enumeration Blocks (CEB) selected at the first

stage and a random selection of 22 households in each CEB at the second stage. At the second stage in both urban and rural areas, households were selected after conducting a complete mapping and household listing operation in the selected first-stage units.

Readers should be cautious while interpreting and comparing the trends as some States/UTs may have smaller sample size. Moreover, at the time of survey, *Ayushman Bharat* AB-PMJAY and *Pradhan Mantri Surakshit Matritva Abhiyan* (PMSMA) were not fully rolled out and hence, their coverage may not have been factored in the results of the percentage of households with any usual member covered under a health insurance/financing scheme and the percentage of mothers who received 4 or more antenatal care visits, respectively. Hence, the results should be interpreted with caution.

NFHS-5 fieldwork for Meghalaya was conducted in all 11 districts of the state from 8 July, 2019 to 15 November, 2019 by IQVIA Consulting and Information Services India Pvt. Ltd. Information was collected from 10,148 households, 13,089 women age 15-49 (including 1,965 women interviewed in PSUs in the state module), and 1,824 men age 15-54.

This report presents the key findings of the NFHS-5 survey in Meghalaya, followed by detailed tables and an appendix on sampling errors. At the time of finalization of this report, wealth quintiles for the country as a whole were not ready. Therefore, on finalization of the national report, the breakup of key indicators by wealth quintiles for all states will be provided as an additional document and uploaded on the official website of MoHFW and IIPS.

HOUSEHOLD CHARACTERISTICS

Important household characteristics include household composition, housing characteristics, household possessions, access to a toilet facility, and education. The household characteristics reflect the environmental risk factors and behavioural outcomes of the household population, including their likely impact on health status.

Household composition

In Meghalaya, over three-quarters (78%) of the households are in rural areas. On average, households are comprised of 4.8 members. Forty-one percent of households are headed by women, with 42 percent of the population living in female-headed households.

Eighty percent of households in Meghalaya have household heads who are Christian. Eleven percent of households have household heads who are Hindu, and 4 percent of households have household heads who are Muslim.

Eighty-nine percent of households in Meghalaya have household heads who belong to a scheduled tribe, 3 percent belong to a scheduled caste. Seven percent of household heads do not belong to a scheduled caste, a scheduled tribe, or another backward class. The majority of households (71%) are nuclear, but 35 percent of the population reside in non-nuclear households.

More than one-third (37%) of Meghalaya's population is under age 15; only 3 percent is age 65 and over. The overall sex ratio of the population is 1,039 females per 1,000 males, and the sex ratio of the population under 7 years of age is lower at 982 females per 1,000 males. Thirty-three percent of persons have an *Aadhaar* card.

Among children below 18 years of age, 8 percent have experienced the death of one or both parents. In all, 80 percent of children below 18 years of age live with both parents, 16 percent live with one parent (mostly with their mother), and the remaining 4 percent live with neither parent. Births of almost all children under 5 years of age (82%) were registered with the civil authorities, and 51 percent of children have a birth certificate.

Death registration

Fifty-four percent of deaths of usual residents of households were registered with the civil authorities.

The distribution of death registrations by religion shows that 71 percent of deaths are registered among Hindus, 54 percent among Christians and 46 percent among other religions. Fifty-four percent of deaths are registered among scheduled tribes. Overall in Meghalaya, death registration is higher in urban areas (61%) than rural areas (53%) and among males (55%) than females (54%).

Disability

The respondent to the Household Questionnaire provided information for all usual household members on whether or not they have any disability in specified domains. The domains of disability are hearing, speech, visual, mental, locomotor, and other. Nearly, one percent (0.8%) of the *de jure* household population has any disability. The minimal type of disability is visual (0.1%). Men are slightly more likely than women to have any disability (0.9% men compared with 0.7% women). The proportion of household members who have any disability generally rises with increasing age. For instance, 2 percent of the household members age 70 and above are reported to have any disability, compared with 1 percent or less of household members in the younger age groups.

Housing characteristics

Less than half (45%) of households in Meghalaya live in a *pucca* house and almost all households (92%) have electricity. More than three-quarters of households in Meghalaya have basic drinking water service, and 79 percent of households use an improved source of drinking water, but only 32 percent have water piped into their dwelling, yard, or plot. Urban households (62%) are more likely than rural households (24%) to have water piped into their dwelling, yard, or plot. Sixty eight percent of households use an appropriate treatment method to make drinking water potable (mostly by boiling). A large majority of households (34%) in Meghalaya use a clean fuel for cooking.

Almost one-third (32%) of households in Meghalaya have water piped into their dwelling, yard, or plot.

Access to toilet facility

Safe sanitation is one of the foundations of a healthy, comfortable, and dignified life. Households without proper sanitation facilities have a greater risk of diseases like diarrhoea, dysentery, and typhoid than households with improved sanitation facilities that are not shared with other households.

In Meghalaya, 4 percent of all households (4% in rural areas and 1% in urban areas) do not use any sanitation facility; they use open spaces or fields. Almost all (96%) households have access to a toilet facility (all households in urban areas and 95% in rural areas). Access to a toilet facility ranges from 96 percent among scheduled tribes to 100 percent among groups that are not scheduled tribes, scheduled castes, or other backward classes. Access to toilet facility varies widely across the districts, ranging from 87 percent in West Jaintia Hills district (86% in the rural areas) to 100 percent in North Garo Hills district. More than 99 percent of urban households have access to toilet facility in all four districts of Garo Hills (East, West, North and South).

Selected household possessions

In Meghalaya, 70 percent of households own a house (76%) of rural households and 48% of urban households). Almost all urban households (94%) and most rural households (86%) in Meghalaya have a mobile phone. Ninety percent of households have a bank or post office account. One-fifth of households own either a motorcycle or a scooter. BPL cards are held by 56 percent of

households. Irrigated land is owned by 14 percent of rural households and 2 percent of urban households. Overall, 33 percent of all households in Meghalaya own agricultural land, and 62 percent of households' own farm animals.

Background characteristics of respondents

Thirty five percent of women and one-third of men are in the 15-24 age group, while 33 percent of both women and men, respectively, are in the 25-34 age group. Nearly four-fifths women and men respectively are in rural areas.

In NFHS-5, literate persons are those who have either completed at least standard 9 or passed a simple literacy test conducted as part of the survey. According to this measure, 88 percent of women age 15-49 and 83 percent of men age 15-49 are literate.

Thirteen percent of women and 20 percent of men age 15-49 have never been to school. Only one-fifth of women and men age 15-49 in Meghalaya have completed 12 or more years of schooling.

Media exposure is quite widespread among women and men in Meghalaya. More than two-fifths (46%) of women and 30 percent of men watch television at least once a week. However, men (13%) are much less likely than women (18%) to read a newspaper or magazine at least once a week. Forty-six percent of women and three-fifths (59%) percent of men are not regularly exposed to print media or other forms of media.

Women are more likely than men to be currently married (61% women versus 57% men) or widowed (3% women versus 0.3% men), while men are more likely than women to be never married (42% women versus 31% men).

A majority of female respondents are Christian (82%), while 10 percent are Hindu, and 6 percent are other religion.

Ninety percent of female respondents belong to scheduled tribes, while 8 percent do not belong to a scheduled caste, a scheduled tribe, or an other backward class. Two percent of women belong to a scheduled caste and 1 percent belong to an other backward class. Almost, 91 percent of men belong to a scheduled tribe, while 8 percent of men do not belong to a scheduled caste, a scheduled tribe, or an other backward class, and only 1 percent belong to a scheduled caste.

Fifty-two percent of women and 18 percent of men age 15-49 were not employed in the 12 months preceding the survey. Five percent of women and 39 percent of men were engaged in an agricultural occupation, while 35 percent of women and 31 percent of men were employed in a non-agricultural occupation.

EDUCATION

In NFHS-5, information related to preschool attendance has been collected for the first time, in addition to school attendance among children age 6-17 years and educational attainment of other members of the household, including reasons for drop-out in the case of those who discontinued education.

Preschool attendance

In India many children attend *anganwadi* centres that provide spaces for children to learn, play, eat nutritious food, and develop the skills needed for a lifetime of learning. Attending preprimary education, such as at an *anganwadi* centre, improves children's school readiness by it providing quality learning through interactive, play methods with qualified instructors. Also, parents or guardians can go to work at ease if children are enrolled in pre-primary education.

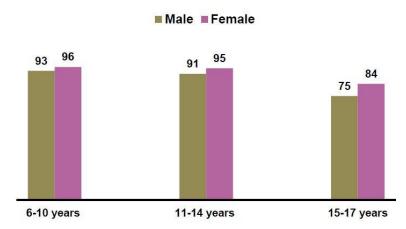

In Meghalaya, 25 percent of boys and 28 percent of girls age 2-4 years attend preschool. Preschool attendance is lower among children in nuclear households (26%) than children in non-nuclear households (28%). Preschool attendance is higher (29%) among children in households with household heads belonging to other religions and households headed by Christians and Hindus (26% each) than households headed by Muslims (25%). Preschool attendance is 27 percent in scheduled tribe households and is lower (24%) in households not belonging to a scheduled caste, a scheduled tribe or an other backward class. Preschool attendance is higher (29%) in households with 3-5 members, compared with households with 6 or more members (25%). Overall, urban households (37%) show more preschool attendance than rural households (25%). Preschool attendance is highest in East Khasi Hills district (38%) and lowest in both West Jaintia and Khasi Hills district (19%).

School attendance among children

Ninety-one percent of children age 6-17 years in Meghalaya attend school (97% in urban areas and 89% in rural areas). School attendance is 94 percent at age 6-14 years but drops sharply to 79 percent at age 15-17 years. There is 4 percent gender disparity in school attendance in the 6-14-year age group; however, in the age group 15-17 years, 84 percent of girls compared with 75 percent of boys are attending school.

Are there gender differentials in children's school attendance?

Percentage of children attending school by age

FERTILITY

This section provides trends in the total fertility rate, age at marriage, pregnancy outcomes, teenage pregnancy, birth interval, the desire for more children, and son preference. NFHS-5 estimates on the median age at marriage, total fertility rate, and teenage motherhood illustrated in this section can help in setting benchmarks for the sustainable development goals at the subnational level.

Age at first marriage

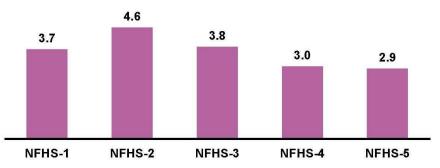

In Meghalaya, the median age at first marriage is 21.9 years among women age 25-29 and 22.1 years age 25-49 years. Only, 17 percent of women age 20-49 years have never married, compared with 28 percent of men age 20-49 years. Less than one-fifth (17%) of women age 20-24 years got married before attaining the legal minimum age of 18 years, unchanged from NFHS-4. More than half (51%) of women age 20-24 years are never married, compared with 78 percent of men in the same age group, showing that the age at marriage is much lower for women than men in Meghalaya.

Fertility levels

The total fertility rate (TFR) in Meghalaya is 2.9 children per woman, which is above the replacement level of fertility. Fertility has decreased by 0.13 children between NFHS-4 and NFHS-5.

The total fertility rate in urban areas, at 1.6 children per woman, and in rural areas, at 3.3 children per woman, Urban fertility rate is below the

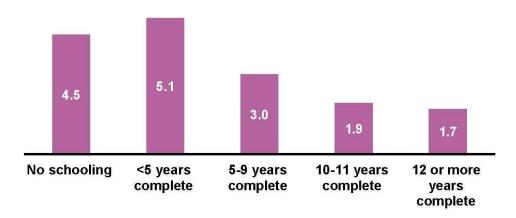

replacement level. Among births in the three years preceding the survey, 36 percent were of birth order four or higher, compared with 33 percent in NFHS-4.

The greatest differentials in fertility are by religion, caste/tribe, and schooling. At current fertility rates, women with no schooling will have an average of 2.8 more children than women with 12 or more years of schooling. Hindu women have lowest TFR (0.82), followed by Muslim women (1.4), Christian women (3.2) and Other religions group of women (3.9). Christian will have an average of 1.7 children more than Muslim women (a TFR of 3.2, compared with 1.4) and 2.4 children more than Hindu (0.82).

How does fertility vary with schooling?

Total fertility rate (children per woman)

Pregnancy outcome

Ninety-five percent of last pregnancies in the five years preceding the survey ended in a live birth, and the remaining 5 percent terminated in foetal wastage (abortion, miscarriage, or stillbirth). Miscarriage is the most commonly reported type of foetal wastage, accounting for 4 percent of all pregnancies, and stillbirths accounted for 1 percent.

Teenage pregnancy

Among young women age 15-19 in Meghalaya, 7 percent have already begun childbearing, that is, they have already had a live birth or are pregnant with their first child, which is the 2 percent from NFHS-4. The proportion of women who have started childbearing rises sharply from 4 percent at age 17 years to 12 percent among women age 18 years and to 22 percent among women age 19 years. The proportion who have started childbearing is much higher among young women who had no schooling (30%) than those with 12 or more years of schooling (1%).

Birth intervals

The median interval between births in the five years before the survey in Meghalaya is 31 months. Ten percent of births take place within 18 months of the previous birth and 27 percent occur within 24 months. The proportion of births occurring within 24 months of a previous birth is particularly high for mothers in the 20-29 age group (32%) and for births occurring after a deceased sibling (54%). More than two-third (61%) of all births occur within three years of the previous birth. Research shows that waiting at least three years between children reduces the risk of infant mortality and has a positive impact on maternal health.

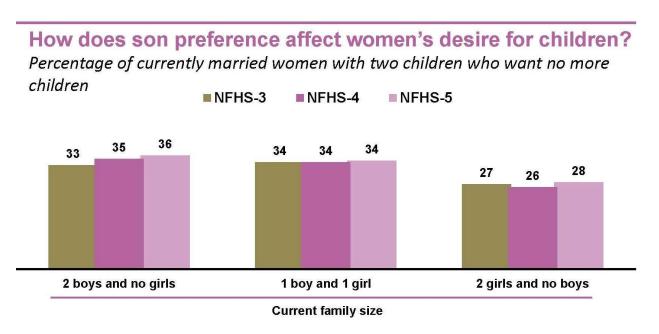

Over three-fifths (61%) of births in Meghalaya occur within three years of the previous birth.

Fertility preferences

Thirty-five percent of currently married women and 34 percent of men age 15-49 years want no more children, are already sterilized, or have a spouse who is sterilized. Among those who want another child, 34 percent of women and 30 percent of men would like to wait at least two years before the next birth. Thirty-two percent of women and 39 percent of men consider the ideal family size to be two or fewer children.

In Meghalaya, being a matriarchal society, there is an indication of a preferences for daughters among women. Fifteen percent of women and 18 percent of men want more sons than daughters, more than one-fifth of women and 12 percent of men want more daughters than sons. However, more than three-quarters of women would like to have at least one son and one daughter, and more than three-fifths of men want at least one son and one daughter.

Women's desire for more children is strongly affected by their current number of living children, particularly their number of sons. For example, among women with two children, 36 percent with two sons and 34 percent with one son want no more children, compared with only 28 percent with two daughters who want no more children. Notably, the one third proportion of currently married women and nearly two fifth men with two children who want no more children irrespective of their number of sons has remained almost unchanged in the 5 years since NFHS-4.

In Meghalaya, unplanned pregnancies are fairly common. If all women were to have only the number of children they wanted, the total fertility rate would have been 2.7 children per woman, instead of the current level of 2.9 children per woman.

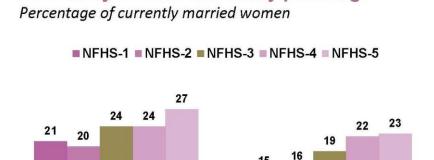

FAMILY PLANNING

The family planning section covers trends in contraceptive knowledge and current use, informed choice, and unmet need for family planning methods among women 15-49 years. It also includes information on men's attitude towards women using a contraceptive method. As in previous rounds of the survey, NFHS-5 provides estimates of the contraceptive prevalence rate and unmet need for family planning.

Contraceptive knowledge and use

Knowledge of contraception is almost universal in Meghalaya. However, some methods are still less well known. Only 30 percent of currently married women know about the lactational amenorrhoea method (LAM) and 34 percent know about female condoms. Among all women, only 43 percent know about emergency contraception.

The contraceptive prevalence rate (CPR) among currently married women age 15-49 is 27 percent in NFHS-5, only 3 percent increase from NFHS-4 (24%). The use of modern family planning methods (23%) has marginal increased from its level in NFHS-4 (22%). The level of use of female sterilization (6%) has almost unchanged, from NFHS-4 to NFHS-5; the share of female sterilization in overall contraceptive use has fluctuated between 20 and 45 percent in all five NFHS surveys. Contraceptive

15

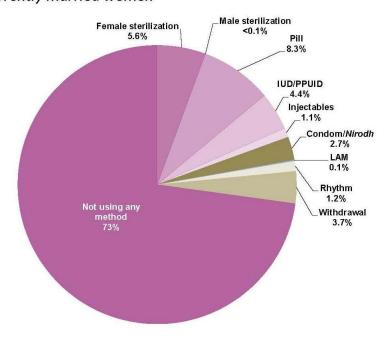

How many women use family planning?

Any method Any modern method use in NFHS-5 increases sharply with age, from 13 percent for women age 15-19 to 32 percent for women age 30-39 followed by 24 percent for women age 40-49.

In Meghalaya, contraceptive use shows little difference in rural and urban areas. Contraceptive prevalence decreases with increasing schooling of women. Six percent of currently married women with no schooling use female sterilization, compared with only 5 percent of women with 12 or more years of schooling. Other religious women (16%) are less likely to use contraception than either Muslim (30%), Hindu (29%) or Christian women (28%).

Women in Meghalaya are much more likely to use contraception if they already have a son. For example, among women with two children, 31 percent with at least one son use a method of family planning, compared with 29 percent of women with two daughters and no sons.

What contraceptive methods do women use? Currently married women

The most common modern spacing methods used by currently married women in Meghalaya is Pills (8%), followed by the female sterilization (6%), any traditional method (5%) and IUD or PPIUD (4%). In general, rural women and better-educated women are more likely than other women to use spacing methods.

Almost three-quarters (73%) of sterilized women had their sterilization operation in the public health sector, mainly in a government or municipal hospital, and 91 percent of IUD or PPIUD users had their IUD insertion in the public health sector. A large majority (76%), of pill users get

their supply from the public health sector including government hospital (14%). However, 45 percent of condom/*Nirodh* users get their supply from the private health sector including pharmacy/drugstore (40%). Nonetheless, 71 percent of injectable and 76 percent of pill users get their supply from the public sector.

The 12-month discontinuation rate for any reason is 50 percent for all contraceptive methods. Just over half (51%) of users of modern spacing methods discontinued use within the first year after they adopted the method. The most common reasons for discontinuation are desire to become pregnant and 'other' method related reason.

Just over half (51%) of users of modern spacing methods discontinued use within the first year after they adopted the method.

Informed choice

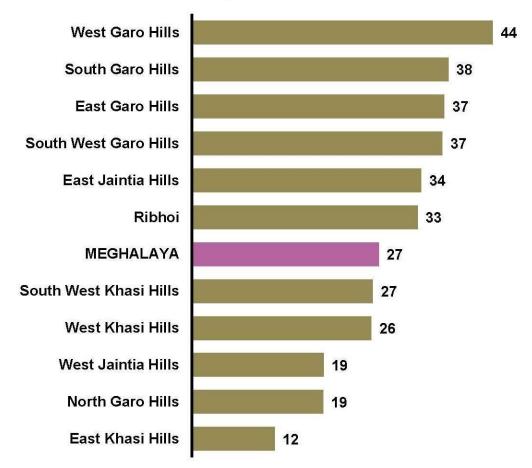

Women who know about all available contraceptive methods and their side effects can make better choices about what method to use. Nearly, three-quarters (71%) of users of selected modern contraceptive methods were ever told by a health or family planning worker about other methods they could use. Only 67 percent were told about the possible side effects or problems with their method, and even fewer (57%) were told what to do if they experienced any side effects.

Men's attitudes

One-fifth (20%) of men age 15-49 in Meghalaya agree that contraception is women's business and a man should not have to worry about it. However, similar percent (20%) of men think that women using contraception may become promiscuous. More than two-fifths of men (43%) know that a condom, if used correctly, protects against pregnancy most of the time.

Contraceptive Prevalence Rate by District

Percentage of currently married women

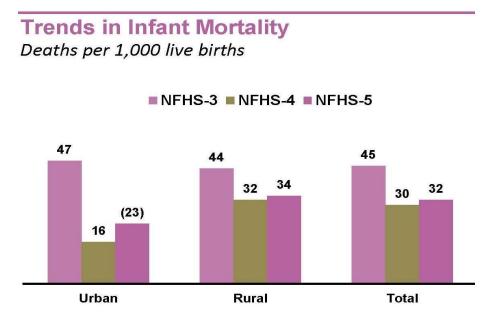

Unmet need

Unmet need for family planning is defined as the percentage of currently married women who either want to space their next birth or stop childbearing entirely but are not using contraception. According to this definition, 27 percent of currently married women have an unmet need for family planning, 6% increased since NFHS-4. Currently, 50 percent of the demand for family planning is being satisfied and 41 percent of the demand is being satisfied by modern methods.

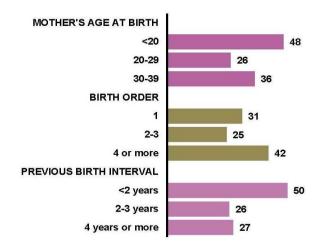

INFANT AND CHILD MORTALITY

The mortality rates among children under age 5 years including neonatal, post neonatal and infant mortality rates is an important indicator that measures the overall wellbeing of a country. The infant mortality rate in Meghalaya in NFHS-5 is estimated at 32 deaths before the age of one year per 1,000 live births, more from the NFHS-4 estimate of 30, the NFHS-3 estimate of 45. The under-five mortality rate (U5MR) is estimated to be 40 deaths before five years of age per 1,000 live births, almost the same as U5MR in NFHS-4 (40 per 1,000).

As expected, boys generally have higher mortality rates than girls, especially during the post neonatal period and before first birthday. Boys have also higher mortality rate than girls during the neonatal period (in the first month after birth).

High-risk births have higher mortality rates Deaths in the first year of life per 1,000 live births

Note: Category "Mother's age at birth 40-49" is not shown since there are fewer than 250 unweighted person-years of exposure to the risk of death.

Children born to mothers under age 20 are more likely to die during infancy than children born to mothers in the prime childbearing age (20-29 years). Infant mortality is 48 per 1,000 live births for teenage mothers and 36 per 1,000 live births for mothers age 30-39, compared with 26 per 1,000 live births for mothers age 20-29.

Infant mortality rates are higher for other religious group than Christian and are also highest for other social groups than scheduled tribes.

The infant mortality rate is 48 per 1,000 live births for children whose mothers have no schooling, 33 per 1,000 live births for less than 10 years of schooling, and is lowest for mothers who have more than 10 years of schooling (18 per 1,000 live births).

Children hour to the temage mathems are more likely to die during

Children born to the teenage mothers are more likely to die during infancy than to mothers age 20-29.

MATERNAL HEALTH

Maternal health is an important aspect for the development of any country in terms of increasing equity and reducing poverty. The survival and well-being of mothers are not only important in their own right, but are also central to solving broader economic, social, and developmental challenges. Maternal health care services are essential for the health and wellbeing of mothers, as well as their children, affecting the overall population and its health and nutritional status. This section describes the utilization of antenatal care, delivery care, and postnatal care by women who reported their last births in the five years preceding the survey. It also shows the extent of male involvement in maternal health care.

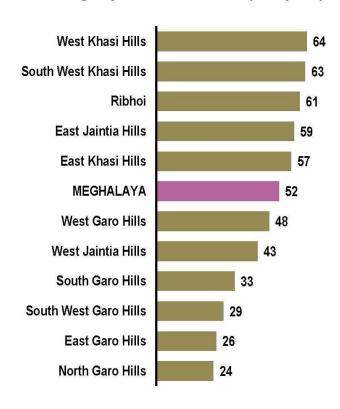

Antenatal care

Among mothers who gave birth in the five years preceding the survey, nearly 9 in 10 received antenatal care for their last birth from a health professional (62% from a doctor and 22 percent from an auxiliary nurse midwife (ANM), lady health visitor (LHV), nurse, or midwife). Thirteen percent did not receive any antenatal care (ANC). Among mothers who gave birth in the five years preceding the survey, 90 percent registered the pregnancy for the most recent live birth. Among the registered pregnancies, 93 percent received a Mother and Child Protection Card (MCP Card).

Just over half (54%) of women received antenatal care during the first trimester of pregnancy, as is recommended. Fifty two percent of mothers had four or more antenatal care visits. Urban women were more likely to have four or more antenatal are visits than rural women.

Four or More Antenatal Care Visits by District

Percentage of last births in the past five years

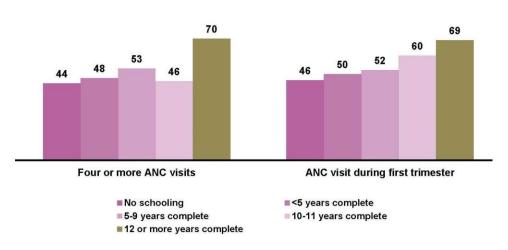

Since NFHS-4, there has been a marginal increase in the percentage of mothers who had an antenatal check in the first trimester (from 53% to 54%) and in the proportion of women who had four or more antenatal care visits (from 50% to 52%). For 85 percent of their last births, mothers received iron and folic acid (IFA) supplements, but only 43 percent consumed them for the recommended 100 days or more and only 21 percent consumed them for the newly recommended 180 days or more. Eighty two percent of last births were protected against neonatal tetanus through tetanus toxoid vaccinations given to the mother. Eight percent of mothers took an intestinal parasite drug during pregnancy.

Fifty-two percent of mothers in Meghalaya had at least four antenatal care visits for their last birth.

Among women with a live birth in the five years preceding the survey who met with a community health worker in the last three months of pregnancy for their most recent live birth, more than 7 in 10 received advice on each of five different areas (89% each on keeping the baby warm and on the importance of institutional delivery, 88% received advice on breastfeeding, 72% on cord care, and 85% on family planning).

How does appropriate antenatal care (ANC) vary with schooling?

Percentage of last births in the past five years

Even when women receive antenatal care, sometimes they do not receive all the services needed to monitor their pregnancy. In Meghalaya, more than 90 percent of women who received antenatal care for their last birth received each of the services needed to monitor their pregnancy: having their blood pressure measured (99%), having their weight taken (98%), having their abdomen examined (95%), having a urine sample taken (93%), and having a blood sample taken (92%).

An ultrasound test was performed during 49 percent of pregnancies in the five years preceding the survey. Women with at least 12 years of schooling were much more likely to have an ultrasound test than women with no schooling. Sixty-six percent of women with at least 12 years of schooling had an ultrasound test compared with 38 percent of women with no schooling. Pregnant women with no sons were much less likely to have an ultrasound test than those with at least one son. For example, among women with two children, those with at least one son (48%) were much more likely to have an ultrasound test during their next pregnancy than those who had no son (46%).

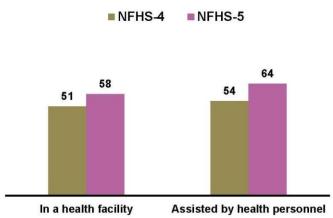

Delivery care

Fifty eight percent of births take place in a health facility (mostly a government facility) and a little over two-fifths (41%) take place at home. The percentage of births in a health facility increased in the past four years from 51 percent (NFHS-4) to 58 percent (NFHS-5). Institutional births are more common among women who have received an antenatal check, women with 12 or more years of schooling, women who are having their first birth, and living in urban areas.

For 63 percent of home births, a clean blade was used to cut the cord, as is recommended. A disposable delivery kit was used for 20

Are babies being delivered safely?

Percentage of births in the past five years

percent of deliveries. Seventy percent of home births followed the recommendation that the baby be immediately wiped dry and then wrapped without being bathed first.

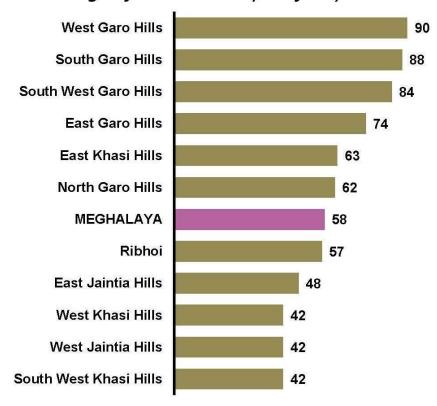

Sixty-four percent of births during the past five years took place with assistance from a skilled provider, and another 12 percent were delivered by a traditional birth attendant.

Eight percent of births during the past five years were delivered by caesarean section. Forty percent of caesarean sections (3% of all births) were emergency caesarean sections.

Among women who had a live birth in the five years preceding the survey that was delivered in a health facility, 23 percent received financial assistance under *Janani Suraksha Yojana* (JSY). Rural women (25%) were more likely than urban women (16%) to receive financial assistance under JSY. Scheduled tribe women (23%) were more likely than women not belonging to a scheduled caste, scheduled tribe or other backward class (21%) to receive financial assistance under JSY.

Institutional Delivery by District

Percentage of births in the past five years

Fifty-eight of children in Meghalaya who were born in the past five years were born in a health facility.

Postnatal care

Early postnatal care for a mother helps safeguard her health and can reduce maternal mortality. In Meghalaya, 69 percent of mothers had a postnatal check after their last birth and 54 percent of mothers had a postnatal check within two days of the birth, as is recommended. Postnatal care is most common for births in a health facility; 65 percent of births in public health facilities and 54 percent in private health facilities were followed by a postnatal check for the mother within two days of birth, compared with 39 percent of home births.

More than half of last births in the five years preceding the survey received a health check in the first two days after birth. Twenty-two percent of home births received a health check in the first two days after birth.

Male involvement in maternal care

Eighty-five percent of men with a child under three years of age said that the youngest child's mother received antenatal care. More than two-fifths of men with a child under three years said they were present during at least one antenatal check received by the child's mother, but only 52 percent were told by a health provider or health worker what to do if the mother had a pregnancy

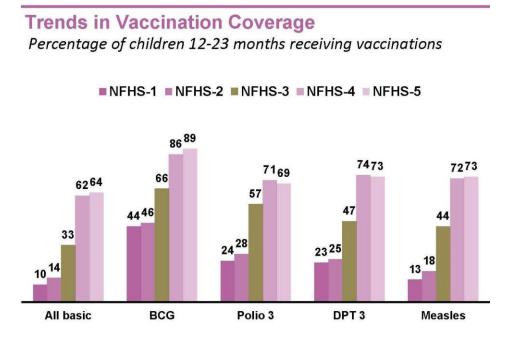

complication. Only 49-63 percent of men were told about the signs of specific pregnancy complications (convulsions, vaginal bleeding, prolonged labour, high blood pressure, and severe abdominal pain).

Most fathers with a child less than three years of age were given information about various aspects of maternal care. Three-quarter of men were told about the importance of proper nutrition for the mother during pregnancy and the importance of delivering the baby in a health facility. Sixty-one percent of men were told by a health provider or a health worker about family planning or delaying the next child. Only 31-67 percent of fathers whose child was not delivered in a health facility were told about the importance of cord care, the importance of keeping the baby warm immediately after birth, and the importance of breastfeeding the baby immediately after delivery.

CHILD HEALTH

Vaccination of children

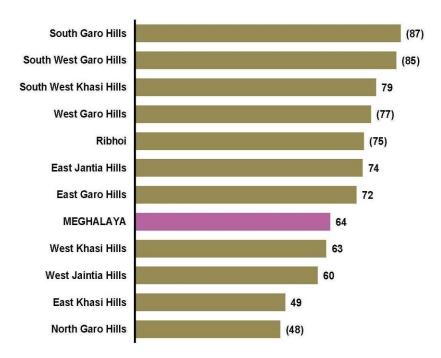

Vaccinations are considered as the most cost-effective intervention that can improve the overall health of children. Sixty-four percent of children age 12-23 months received all basic vaccinations against six major childhood illnesses (tuberculosis, diphtheria, pertussis, tetanus, polio, and measles) at any time before the survey. However, 91 percent of children are at least partially vaccinated; only 9 percent have not received any vaccinations at all. Vaccinations were recorded from a vaccination card for a large majority (77%) of children, which is a substantial increase since NFHS-4 (67%).

Eighty-nine percent of children have received a BCG vaccination. However, 69 percent have received the recommended three doses of polio vaccine and, 73 percent each have received the three recommended doses of DPT or Penta vaccine, and have been vaccinated against measles. There is considerable dropout between the first and third doses of DPT vaccine (from 82% to 73%) and polio vaccine (from 84% to 69%). It should be noted that the Penta vaccine was not widely available at the time of the NFHS-4 survey.

Between NFHS-4 and NFHS-5, there is a slight decline in vaccination coverage for three doses of DPT (from 74% to 73%), three doses of polio vaccine (from 71% to 69%), and BCG (from 86% to 89%). The coverage for measles increased marginally from 72 percent to 73 percent. Overall, there was an encouraging change in the coverage of all basic vaccinations (from 61% to 64%). In addition, almost four-fifths (78%) of children have received at least one dose of hepatitis B vaccine, and 66 percent children have received all three recommended doses of hepatitis B vaccine.

Coverage of All Basic Vaccinations by District Percentage of children 12-23 months

Coverage with all basic vaccinations is higher for boys than girls (65% versus 63%) and for rural than urban areas (65% versus 58%). Coverage with all basic vaccinations is much lower among children of mothers with no schooling, compared with children of mothers with 12 or more years of schooling (72%).

Childhood illnesses

In the two weeks before the survey, 5 percent of children under age five years had symptoms of an acute respiratory infection (cough accompanied by (1) short, rapid breathing that is chest related and/or (2) difficult breathing that is chest related). Of these children, 68 percent were taken to a health facility or health provider.

Twenty-three percent of children under age five were reported to have had fever in the two weeks preceding the survey; 77 percent of these children were taken to a health facility or provider for treatment.

Overall, 10 percent of children under age five years had diarrhoea in the two weeks preceding the survey. Sixty-nine percent of these children were taken to a health facility or health provider. Ninety-seven percent of mothers of young children have heard of oral rehydration salt (ORS) packets for the treatment of diarrhoea, but only 73 percent of children with diarrhoea were given ORS. Forty two percent of children with diarrhoea were given gruel and almost three-quarters (80%) were given any type of oral rehydration therapy (ORT). Forty-one percent were given zinc supplements. Nine percent of children with diarrhoea did not receive any type of treatment at all.

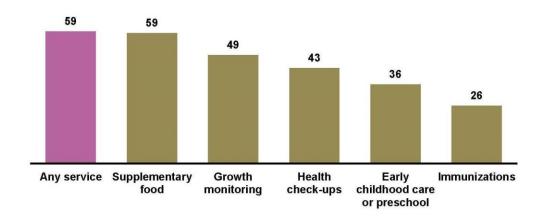

To reduce dehydration and minimise the effects of diarrhoea on nutritional status, it is recommended that normal feeding of children be continued when they have diarrhoea and that the amount of fluids given should be increased. However, in Meghalaya only 3 percent of children with diarrhoea received more to drink than normal. Only 42 percent of children received the same amount to drink as usual. Of greater concern, almost 55 percent of children with diarrhoea were given less to drink or nothing at all to drink. Only 41 percent of children with diarrhoea were given the same amount of food or more food, as recommended.

Integrated Child Development Services (ICDS)

The ICDS programme provides nutrition and health services for children under age six years and pregnant or breastfeeding women, as well as preschool activities for children age 3-5 years. These services are provided through community-based *anganwadi* centres.

Percentage of age-eligible children receiving services

Fifty-nine percent of children under 6 years received services of some kind from an *anganwadi* centre in the 12 months preceding the survey. The most common services that age-eligible children receive are supplementary food (59%), growth monitoring (49%), health check-ups (43%), and early childhood care or preschool (36%). The service that is least likely to be accessed is immunizations (26%). Slightly more than half (61%) mothers of children who were weighed at an *anganwadi* centre received counselling from an *anganwadi* worker or an ANM. Among children under 6 years, more than half (54%) of their mothers received any service from an *anganwadi* centre during pregnancy, and half (50%) of their mothers received any service while breastfeeding.

BREASTFEEDING, NUTRITION, AND ANAEMIA

Infant feeding

Although breastfeeding is nearly universal in Meghalaya, only 43 percent of children under 6 months are exclusively breastfed, as the World Health Organization (WHO) recommends. Ninety-five percent are put to the breast within the first day of life, but only 80 percent started breastfeeding in the first hour of life (as recommended). While exclusive breastfeeding indicators show an improvement since NFHS-4, many infants are still deprived of the highly nutritious first milk (colostrum) and the antibodies it contains.

It is recommended that nothing be given to children other than breastmilk even in the first three days when the milk has not begun to flow regularly because pre-lacteal feeds limit the frequency of suckling by the infant and expose the baby to the risk of infection. However, 18 percent of children are given something other than breastmilk during the first three days. Overall, 81 percent of children continue breastfeeding at 1 year and nearly half (51%) continue breastfeeding at 2 years. The median duration of breastfeeding is 22 months, which is the age to which half of children are breastfed.

After the first 6 months, breastmilk is no longer enough to meet the nutritional needs of infants. Therefore, complementary foods should be added to the diet of the child. However, at age 6-8 months, only 66 percent of children in Meghalaya receive breastmilk and complementary foods.

WHO has several recommendations for infant and young child feeding (IYCF) practices for children age 6-23 months. The key IYCF indicators measure the adequacy of dietary diversity and meal frequency for breastfed and non-breastfed children. Nearly, half (48%) of children age 6-23 months are fed the recommended minimum number of times per day and even fewer (55%) are fed from the appropriate number of food groups. Only 29 percent are fed according to all three recommended practices.

Micronutrient deficiency is a major contributor to childhood morbidity and mortality. Vitamin A is an essential nutrient for the immune system. Severe vitamin A deficiency (VAD) can cause eye damage and a higher risk of dying from measles and diarrhoeal disease. The Government of India recommends that children under 5 years of age receive vitamin A supplements every six months, starting at age 9 months. In Meghalaya, more than two-thirds (61%) of children age 9-35 months were given a vitamin A supplement in the past six months, but only 71 percent of children age 6-23 months ate vitamin A-rich foods during the day or night before the survey.

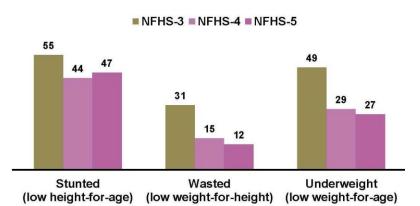

Iron deficiency is a primary cause of anaemia. Eating foods rich in iron and taking iron supplements can help prevent anaemia. Sixty percent of children age 6-23 months ate iron-rich foods during the day or night before the survey; however, 33 percent of children in the same age group were given iron supplements in the week before the survey.

Children's nutritional status

Childhood undernutrition contributes to childhood diseases and is a major cause of child mortality in India. Forty-seven percent of children under age five years are stunted, or too short for their age, which indicates that they have been undernourished for some time. Twelve percent are wasted, or too thin for their height, which may result from inadequate recent food intake or a recent illness causing weight loss, and 5 percent are severely wasted. Twenty-seven percent are underweight, which takes into account both chronic and acute undernutrition. Even during the first six months of life when almost all babies are breastfed, 23 percent of children are stunted, 15 percent are wasted, and 18 percent are underweight.

Children's nutritional status in Meghalaya has slightly changed since NFHS-4 by all measures. The percentage of children who stunted marginally increased by 3 percent from 44 percent to 47 percent in the 4 years between NFHS-4 and NFHS-5. The percentage of children who are underweight (27%) or wasted (12%) has marginally decline since NFHS-4. However, the continuing high levels of undernutrition are still a major problem in Meghalaya.

Trends in Children's Nutritional Status Percentage of children under five years

Note: Nutritional status estimates are based on the 2006 WHO International Reference Population

Differences in the levels of malnutrition are more pronounced for several background characteristics of children. Malnutrition generally decreases with increasing mother's schooling, better nutritional status of the mother, and larger child's size at birth. The level of undernutrition is relatively high for rural children and children of higher birth orders. It is generally higher among scheduled caste children and lower among Hindu children than among children of any other religions. Malnutrition is somewhat higher for male children than female children on all three nutritional status measures.

Adults' nutritional status

Malnutrition refers to deficiencies, excesses, or imbalances in a person's intake of energy and/or nutrients and includes undernutrition as well as overweight and obesity. The body mass index (BMI), which is defined as a person's weight in kilograms divided by the square of the person's height in metres, is a measure that indicates the nutritional status in adults.

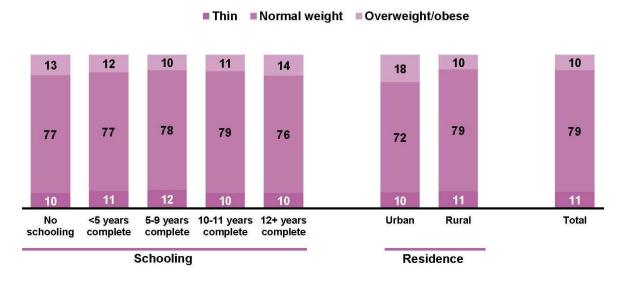

More than one-fifths (22%) of women and 23 percent of men are either too thin or overweight or obese. Among women age 15-49, the proportion overweight or obese is 12 percent, which is approximate the same as in NFHS-4. More men are overweight or obese (14%) than thin (9%), which is reverse to the pattern observed in NFHS-4. Eleven percent of women in Meghalaya are too thin. Over three-quarters (77% each) of women and men are at a healthy weight for their height.

Undernutrition is particularly common in the younger age groups (especially age 15-19), in rural areas for women, and among scheduled caste. Overweight and obesity are most prevalent in older adults, those in urban areas, and well-educated men.

For the first time, the 2019-20 NFHS measured the waist circumference and hip circumference of women and men age 15-49 years. This information was used to calculate the waist-to-hip ratio (WHR). WHR helps to identify the distribution of body fat and predicts abdominal obesity. Abdominal obesity is associated with an increased risk of type 2 diabetes mellitus, myocardial infarction, stroke, and premature death.

Three-fifths (60%) of women and 25 percent of men have a waist-to-hip ratio (WHR) that puts them at a substantially increased risk of metabolic complications. The proportion of adults with such increased risk WHR increases with age, from 50 percent for women age 15-19 to 70 percent for women age 40-49, and from 15 percent for men age 15-19 to 33 percent for men age 40-49. The proportion of women having a substantially increased risk of WHR is much higher in rural areas (62%) than in urban areas (55%) and among men it is slightly higher in urban areas (29%) than in rural areas (24%).

How many women are at a healthy weight for their height? Percent distribution of women

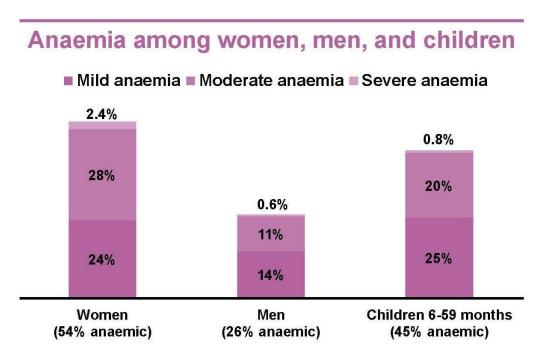

The use of iodized salt prevents iodine deficiency, which can lead to miscarriage, goitre, and mental retardation. Ninety-one percent of households with tested salt were using iodized salt at the time of the survey.

Anaemia

Anaemia is a condition that is marked by low levels of haemoglobin in the blood. Iron deficiency is estimated to be responsible for about half of all anaemia globally, but anaemia can also be caused by malaria, hookworms and other helminths, other nutritional deficiencies, chronic infections, and genetic conditions. Anaemia can result in maternal mortality, weakness,

diminished physical and mental capacity, increased morbidity from infectious diseases, perinatal mortality, premature delivery, low birth weight, and (in children) impaired cognitive performance, motor development, and scholastic achievement. Anaemia is a major health problem in Meghalaya, especially among women and children.

More than two-fifths (45%) of children age 6-59 months are anaemic. This includes 25 percent who are mildly anaemic, 20 percent who are moderately anaemic, and 1 percent who have severe anaemia. The overall prevalence of anaemia in children increased from 41 percent in NFHS-4 to 45 percent in NFHS-5. There is no difference in the prevalence of anaemia among girls and boys in NFHS-5. Children of mothers who have anaemia are much more likely to be anaemic. Although anaemia levels vary somewhat according to background characteristics, anaemia among children is widespread in every group. Over one-third (35%) of children in Meghalaya are anaemic even if their mother has 12 or more years of schooling.

Fifty-four percent of women in Meghalaya have anaemia, including 24 percent with mild anaemia, 28 percent with moderate anaemia, and 2 percent with severe anaemia. Anaemia is particularly high among rural women, women age 40-49, and women not belonging to a scheduled caste, a scheduled tribe, or an other backward class, but anaemia ranges 45-62 percent for all background characteristics of women. Anaemia among women has decreased by 2 percentage points since NFHS-4. Over one-quarter (26%) of men in Meghalaya are anaemic. Men age 15-19 and age 40-49, and men in rural areas are particularly likely to be anaemic. Men with 10 or more years of schooling are less likely to be anaemic, compared with men with no schooling or less than 10 years of schooling.

ADULT HEALTH AND HEALTH CARE

Tuberculosis

Tuberculosis is an infectious disease caused by a type of bacterium called Mycobacterium tuberculosis, which primarily affects the lungs. Tuberculosis is transmitted from person to person through the air, and people with lowered immunity, HIV, malnutrition, diabetes, and those who use tobacco or alcohol have higher chances of falling ill. Tuberculosis is both preventable and curable, however mortality is high if not treated properly. In Meghalaya, 626 persons per 100,000 are estimated to have medically treated tuberculosis, based on reports from household respondents. The prevalence of medically treated tuberculosis is lower among men (623) than among women (629) and is higher among age below 15 years (1,278) than age 60 and over years (524).

A large majority of respondents have heard of tuberculosis (85% of women and 79% of men), but even among those who have heard of tuberculosis, only 68 percent of women and 69 percent of men know that it is spread through the air by coughing or sneezing. Nearly, three-fifths (57%) of women and 62 percent of men have misconceptions about how tuberculosis is spread. Overall, 87 percent of women and 88 percent of men know that tuberculosis can be cured, and only 11 percent of women and 35 percent of men say that if a family member had tuberculosis, they would want to keep it a secret.

Diabetes, asthma, goitre, heart disease, and cancer

According to self-reports, 1,916 women and 988 men age 15-49 per 100,000 have diabetes. Overall, 2,574 women and 2,824 men per 100,000 suffer from asthma. The prevalence of asthma is higher among women in urban and men in rural areas. Prevalence is high among older age groups of women and men, and among women those who have less than 9 years schooling and men 5-9 years schooling. Goitre is less common than diabetes and asthma among women and men (1,988 women and 631 men per 100,000). The prevalence of any heart disease is higher among women (985 per 100,000) than among men (869 per 100,000). Among the five diseases, cancer is the least common, with 84 women per 100,000 reportedly having cancer.

Blood pressure (hypertension)

Blood pressure is the force exerted by circulating blood against the arterial walls. Hypertension or high blood pressure is a condition in which the blood vessels have persistently raised pressure. Hypertension is major risk factor for cardiovascular diseases, chronic kidney diseases, and brain diseases, and it is a major cause of premature deaths worldwide. Some of the risk factors for developing hypertension are unhealthy diets, physical inactivity, alcohol and tobacco consumption, and excess body weight.

Fourteen percent of women age 15-49 in Meghalaya have hypertension, including 7percent with Stage 1 hypertension and 2 percent with Stage 2 and 1 percent with Stage 3 hypertension. Hypertension also includes women with normal blood pressure who are taking medicine to lower their blood pressure. Fifty-two percent of women have normal blood pressure.

The prevalence of hypertension among men age 15-49 is somewhat lower than among women. Eighteen percent of men in Meghalaya have hypertension, including 14 percent with Stage 1 hypertension, 2 percent with Stage 2 hypertension, less than 1 percent (0.4%) with Stage 3 hypertension. Hypertension also includes men with normal blood pressure who are taking medicine to lower their blood pressure. Thirty-six percent of men have normal blood pressure. For both women and men, hypertension increases with age.

Blood glucose

Diabetes mellitus is a chronic metabolic disease characterized by elevated levels of blood glucose. Diabetes over a period of time can cause severe damage to the heart, blood vessels, retina, kidneys, and nerves, and it puts sufferers at increased risk of various infectious and non-infectious diseases. Early diagnosis, determined by blood glucose testing, and adequate treatment are the key steps for managing diabetes and its complication. NFHS-5 has included random blood glucose measurement using capillary blood among women and men age 15 and above.

In Meghalaya, four percent of women age 15-49 have high blood glucose levels, and 2 percent have very high blood glucose levels. In comparison, 8 percent of men age 15-49 have high and 4 percent have very high blood glucose levels. Women and men in older age groups and those with 0-5 years of schooling have relatively high blood glucose levels.

Men are more likely than women to have normal blood glucose levels and are taking medicine to lower their blood glucose level (2% of men versus 1% of women). Less than one percent of both women (0.3%) and men (0.2%) have blood glucose levels ≥140 mg/dl and are taking medicine to lower their blood glucose level.

Screening tests for cancer

Cancer is a group of diseases with high mortality, and it is the second leading cause of death globally. The chances of successful treatment of cancer increase if diagnosed early. One way of early detection is screening, which is identification of unrecognized disease by using simple tests or examinations among those individuals who have the disease but do not yet have symptoms. NFHS-5 collected information about whether respondents had ever undergone screening test for cancer of the oral cavity, breast, and cervix.

In Meghalaya, less than 1 percent of women (0.5%) age 15-49 have ever undergone a screening test for cancer of the cervix, breast and oral cavity (0.3% each), which is slightly less in men (0.6%).

Health insurance

Universal access to health care is the absence of any barriers in health care, including economic barriers. Adequate coverage by health insurance protects a person from financial hardships because of the costs of health care. Despite the emergence of a number of health insurance/financing schemes in India, only 64 percent of households in Meghalaya have any kind of health insurance/financing scheme that covers at least one member of the household. Health insurance/financing scheme is the higher in rural (67%) than urban areas (53%). In Meghalaya, three types of programmes dominate: the State health insurance scheme, the *Rashtriya Swasthya Bima Yojana* (RSBY) and the Central Government Health Scheme (CGHS).

Almost 62 percent of women and 57 percent of men age 15-49 in Meghalaya are covered by any health insurance/financing scheme. Older women and men are more likely to be covered than younger women and men. Health insurance/financing scheme coverage is higher among both women and men with 10-11 years of schooling than among those with no schooling.

Tobacco and alcohol use

Over three-fifths (61%) of men, and 25 percent of women, age 15-49 use some form of tobacco. Tobacco products mostly used by men are cigarettes (50%), bidis (23%), paan with tobacco (8%), khaini (3%) and gutkha or paan masala with tobacco (2%). Among women and men, the use of any form of tobacco is same as in rural areas (25% for women and 61% for men) than in urban areas (25% for women and 60% for men). Most men who smoke cigarettes smoked fewer than five cigarettes in the past 24 hours.

In Meghalaya, among adults age 15-49, 9 percent of women and 21 percent of men drink alcohol, and the consumption is much higher in the urban areas. In rural areas, 8 percent of women and 17 percent of men drink alcohol. In urban areas, 12 percent of women and 37 percent men drink alcohol. Most men who drink alcohol drink it about once a week (45%) or less than once a week (44%), and 12 percent drink almost every day.

HIV/AIDS

This section presents the findings from NFHS-5 on HIV/AIDS knowledge and attitudes, prior HIV testing, and the prevalence of sexually transmitted infections (STIs), as well as sexual behaviour of the adult and youth population. Questions on HIV/AIDS were included only in the subsample of households selected for the state module.

Awareness of HIV or AIDS

Eighty-six percent of women in Meghalaya have heard of HIV or AIDS. In urban areas, 89 percent know about HIV or AIDS, compared with 85 percent in rural areas. Women age 30-39 are more likely (88%) than younger women age 15-19 and older women age 40-49 (83% each) to have heard of HIV or AIDS. Women with no schooling (70%) and women with no regular exposure to media (81%) are less likely than other women to have heard of HIV or AIDS.

Men are less likely than women to know about HIV or AIDS. Eighty-four percent of men in Meghalaya have heard of HIV or AIDS, including 87 percent in urban areas.

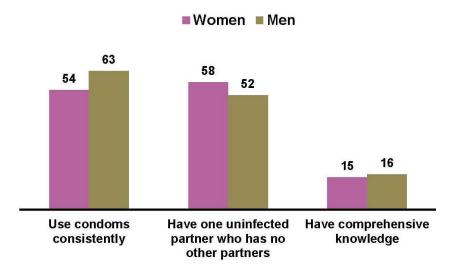

Knowledge of prevention and transmission

Men are much more likely than women to know how HIV/AIDS is transmitted and how to keep from getting it. For example, only 54 percent of women know that consistent condom use can help to prevent HIV/AIDS, compared with 63 percent of men, and 58 percent of women know that having just one uninfected partner who has no other partners can reduce the chance of getting HIV/AIDS, compared with 52 percent of men.

Only 15 percent of women and 16 percent of men in Meghalaya have 'comprehensive knowledge' about HIV/AIDS. This means they know that consistent use of condoms every time they have sex and having just one uninfected sex partner who has no other partners can reduce the chance of getting HIV/AIDS, they know that a healthy-looking person can have HIV/AIDS, and they reject two common misconceptions about the transmission or prevention of HIV/AIDS.

Do people know how to prevent HIV/AIDS?

Percentage of women and men age 15-49

HIV-related stigma

More than three-fifths (65%) of women and 67 percent of men in Meghalaya would be willing to take care of a relative with HIV/AIDS in their home. A similar proportion of women (48%) and men (49%) say that a female teacher who has HIV/AIDS but is not sick should be allowed to continue teaching. Over one quarter (27%) of women and 38 percent of men say that they would buy fresh vegetables from a shopkeeper with HIV/AIDS. Forty-eight percent of women and 41 percent of men say that if a family member got infected with HIV/AIDS, they would not want to keep it a secret.

An almost equal proportion of women (47%) and men say that an HIV positive student should be allowed to attend school with students who are HIV negative. Over one-third of women (34%) and two-fifths of men (46%) think that people living with HIV/AIDS should be treated in the same public hospital as persons who are HIV negative. Almost two-fifths (46%) women and men (47%) think that people living with HIV should be allowed to work in the same office with people who are HIV negative.

HIV testing prior to NFHS-5, blood transfusions, and safe injections

Only 24 percent of women and 5 percent of men age 15-49 had ever been tested for HIV prior to NFHS-5. Women and men in urban areas are somewhat more likely to have ever been tested for HIV prior to NFHS-5 than rural women and men. Thirty-one percent of women who had a live birth in the past five years and received ANC during pregnancy were tested for HIV during ANC. Urban women (37%) are slightly less likely than rural women (30%) to have been tested for HIV during ANC.

Thirty-one percent of women who had a live birth in the past five years and received ANC during pregnancy were tested for HIV during ANC.

In Meghalaya, 8 percent of women and 5 percent of men have ever had a blood transfusion. Women are more likely than men to have received an injection in the past 12 months (20% of women, compared with 13% of men). A disposable syringe was used for injections for 83 percent of adults who received an injection in the past 12 months.

SEXUAL BEHAVIOUR

NFHS-5 included questions on respondents' sexual behaviour. Respondents were asked about their age at first sex, their current and previous sexual partners, higher-risk intercourse, and condom use. In addition, men were asked whether they had paid for sex in the past year. These questions are sensitive and subject to reporting bias, so the results should be interpreted with caution.

Higher-risk behaviour

Higher-risk sex is sexual intercourse with someone who is neither a spouse nor a cohabiting partner. Among those who had sex in the past 12 months, only 3 percent of women and 11 percent of men reported having had higher-risk sex during the past 12 months. The percentage of men who had higher-risk sexual intercourse in the past 12 months is somewhat higher (20%) in urban areas than in rural areas (8%). Even fewer respondents said that they had multiple sex partners in the past 12 months (0.3% of women and 1% of men).

More than four-fifths (42%) of those who had higher-risk sex in the past 12 months reported using a condom the last time they had higher-risk sex. Less than one percent (0.4%) of men said they had paid for sex in the past year.

WOMEN'S EMPOWERMENT

Empowering women and promoting gender equality in every sphere of life are essential to improving their lives and achieving the sustainable development goals. NFHS-5 has collected information related to women's empowerment and autonomy, including menstrual hygiene, employment and earnings, decision-making, ownership of assets, gender role attitudes, and domestic violence.

Women's hygiene

Using a hygienic method of menstrual protection is important for women's health and personal hygiene. In NFHS-5, young women age 15-24 were asked what method or methods they use for menstrual protection, if anything. In Meghalaya, 60 percent use sanitary napkins, 63 percent use cloth, 8 percent use locally prepared napkins, and 1 percent use tampons. Overall, 65 percent of women age 15-24 use a hygienic method of menstrual protection, up from 64 percent in NFHS-4. Notably, only 59 percent of rural women use a hygienic method of menstrual protection, compared with 85 percent of urban women.

Employment and earnings

Only 48 percent of all women age 15-49, compared to 82 percent of men, were employed in the 12 months preceding the survey. Among employed women, 84 percent earned cash, including 21 percent who earned both cash and in-kind. Twelve percent were not paid at all. More men who were employed earned cash (93%), including 28 percent who earned both cash and in-kind. Five percent of employed men were not paid at all. A large majority (89%) of employed women work in non-agricultural occupations, compared with 52 percent of employed men.

Only 48 percent of all women age 15-49 were employed in the 12 months preceding the survey.

Decision making

Currently married women were asked who makes decisions about their own health care, major household purchases, and visits to their own family or relatives. Women are somewhat more likely to participate in decisions about their own health care (89%) than decisions about visits to their own family and relatives (90%) or about major household purchases (87%). Overall, 84 percent of currently married women participate in making all three of these decisions, and 8 percent do not participate in making any of the three decisions. Participation in all three decisions generally varies by age and is higher among women employed for cash (87%), compared with 81 percent women who are not employed.

In case of currently married men, they are much more likely than women to report that they alone or jointly with their wives participated in making decisions about their own health care (95%) and 94 percent participated in decisions about major household purchases. Three percent of men did not participate in making either of these decisions.

Other indicators of women's empowerment

In Meghalaya, 49 percent of women have money that they can decide how to use. The proportion of women who have money that they can decide how to use is higher among urban (56%) than rural (47%) women, increases sharply with age, is much higher among women with 12 or more years of schooling (64%), and is highest among women who are employed for cash (71%) than any other group of women.

Seven in ten of women have a bank or savings account that they themselves use.

Seventy percent of women have a bank or savings account that they themselves use. This percentage is highest among women who have 12 or more years of schooling (90%) followed by women who are employed for cash and women age 40-49 (82% each). Women's knowledge and use of microcredit programmes is very limited. More than one-fifths of women aware of a microcredit programme in their area, but only 6 percent have ever taken a loan from a microcredit programme.

Less than one-fifths (16%) of women who have a mobile phone use it for financial transactions. Urban women are more than twice (24%) as likely to use a mobile phone for financial transactions, than rural women (13%). This percentage increases with education with 31 percent of women with 12 or more years of education using a mobile phone for financial transactions, compared with less than one-tenth of women having less than five years of schooling (7%) or no schooling (4%). Less than one-quarter (18%) of employed women who earn in cash use a mobile phone for financial transactions, compared with 17 percent of employed women who don't earn in cash. Women who are not Hindu or Christian are least likely (11%) to use a mobile phone for financial transactions, compared with Hindu (19%) and Christian women (15%). Women not belonging to a scheduled caste, a scheduled tribe, or other backward class are less likely (14%) to use a mobile phone for financial transactions than women belonging to scheduled tribe (16%).

Ownership of assets

Sixty-four percent of women and 48 percent of men age 15-49 in Meghalaya own a house alone or jointly with someone else, and 45 percent of women and 38 percent of men own land alone or jointly with someone else. Among men and women, ownership of a house and land is more common in rural than urban areas.

Sixty-four percent of women own a house alone or jointly with someone else, and 45 percent of women own land alone or jointly with someone else.

In Meghalaya, 68 percent of women have a mobile phone that they themselves use, and among women who have a mobile phone that they themselves use, 84 percent can read SMS messages. Seventy-eight percent of urban women have a mobile phone they themselves use, compared with 64 percent of rural women. Mobile phone access increases substantially with education, from 46 percent among women with no schooling to 95 percent among women with 12 or more years of schooling. Only 68 percent of women scheduled tribe women have a mobile phone they themselves use, compared with 71 percent of women in other caste. Scheduled tribe women who have a mobile phone that they themselves use are also more likely to be able to read SMS messages (84%) than women who belong to any caste/tribe other group (83%).

Sixty-eight percent of women in Meghalaya have a mobile phone that they themselves use.

Gender-role attitudes

Thirty-two percent of women agree that a husband is justified in hitting or beating his wife under some circumstances. Women are most likely to agree that wife beating is justified if she neglects the house or children (20%) followed by if he suspects her of being unfaithful (17%), and if a woman shows disrespect for her in-laws (15%) and Men are same likely to agree: 32 percent say that wife beating is justified in some circumstances, especially if the wife shows disrespect for inlaws (18%) or if she suspects her of being unfaithful (16%) and if she neglects the house or children (15%) and if she argues with him (10%). Even among women and men who have

completed at least 12 years of schooling, 28 percent of women and 34 percent of men say that a husband is justified in beating his wife for one or more of the specified reasons.

Sixty-eight percent of women and 39 percent of men believe that a woman is justified in refusing to have sex with her husband if she knows he has a sexually transmitted disease, if she knows he has intercourse with other women, and if she is tired or not in the mood. More than half of men (53%) agree that if a wife refuses to have sex with her husband he does not have a right to get angry and reprimand her, refuse to give her financial support, use force to have sex even if she doesn't want to, or have sex with another woman.

DOMESTIC VIOLENCE

The World Health Organization recognizes that violence against women, particularly domestic or spousal violence, is a major public and clinical health problem and a violation of women's human rights, which also reflects the scale of gender inequality and discrimination against women. The consequences of violence on physical, mental, sexual, and reproductive health often last a lifetime. NFHS-5 collected information on domestic violence from women age 18-49, related to behaviours of her husband that cause physical, sexual or emotional harm, including physical violence, sexual coercion, emotional abuse, and controlling behaviours. Information was also collected on violence during pregnancy and help seeking behaviour for any violence experienced.

In Meghalaya, 14 percent of women age 18-49 have ever experienced physical violence, and 6 percent have ever experienced sexual violence. In all 16 percent of women experienced physical or sexual violence and 4 percent experienced both physical and sexual violence. For ever-married women who experienced physical violence since age 15, the most common perpetrator was the current husband.

Nearly one-fifth (18%) of ever-married women age 18-49 in Meghalaya have experienced physical or sexual violence.

Violence during pregnancy

Two percent of women age 18-49 who have ever been pregnant have ever experienced physical violence during one or more of their pregnancies. Women with less than 5-7 years of schooling, women with 1-2 children, and women who are widowed, divorced, separated, or deserted are more likely to experience violence during pregnancy than women in any other group.

Spousal violence

In Meghalaya, 14 percent of ever-married women age 18-49 have experienced any form of physical violence committed by their husband, 7 percent have experienced any form of sexual violence committed by their husband, and 14 percent have experienced any form of emotional violence committed by their husband. Ten percent of ever-married women report having been slapped by their husband. Five percent report being pushed, shaken, or having something thrown at them. Four percent experienced having their arm twisted or hair pulled, 4 percent being punched with a fist or something that could hurt her, 4 percent report being kicked,

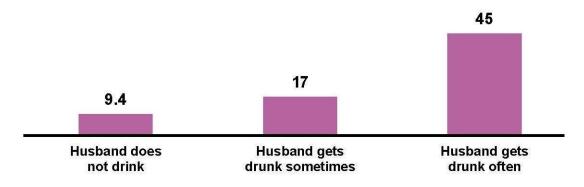

dragged, or beaten up, and 1 percent that her husband tried to choke or burn her on purpose.

Five percent of ever-married women age 18-49 report that their husband have physically forced them to have sex even when they did not want to, and 2 percent report that their husband forced them with threats or in any other way to perform sexual acts they did not want to perform. Overall, 16 percent of ever-married women have experienced spousal physical or sexual violence from their current husband or, if not currently married, from their most recent husband. Few ever-married women (3%) reported that they have initiated violence against their husband when he was not already beating or physically hurting them.

Spousal violence prevails across all groups. Although spousal violence is much lower among more educated women, nearly 4 in 10 (37%) women who have 10-11 years of schooling have experienced emotional, physical, or sexual spousal violence. The experience of spousal violence is higher among women in urban areas (31%) than in rural areas (19%); among divorced, separated, or deserted women (46%) than women married more than once (41%); and among women who are employed not for cash (32%) than women who are not employed (16%). Husband's characteristics are also related to overall spousal violence (emotional, physical, or sexual). For instance, women are more likely to experience spousal violence if their husband displays 3-4 marital control behaviours (68%) and gets drunk often (53%). More than two-fifths of women (43%) of women who say they are afraid of their husband most of the time have experienced spousal violence. The contextual and intergenerational aspects of spousal violence are clear from the fact that women whose mothers were beaten by their fathers are more likely to be in abusive marriages themselves.

Is alcohol use related to spousal physical or sexual violence?

Percentage of ever-married women experiencing violence

Note: Category "Husband drinks, but never gets drunk" not shown since there are fewer than 25 unweighted cases

Over one-quarter of ever-married women age 18-49 who have ever experienced physical or sexual violence reported suffering from injuries from what their husband did to them. More than

two-fourths (44%) of women who have experienced both physical and sexual violence. The most common types of injuries among ever-married women who have experienced physical and sexual violence are cuts, bruises, or aches (40%); eye injuries, sprains, dislocations, or minor burns (31%); deep wounds, broken bones, broken teeth, or any other serious injury (14%); and severe burns (2%).

Help seeking

Only 17 percent of women age 18-49 who have ever experienced physical or sexual violence sought help, while 19 percent never sought help but told someone. Almost two-thirds (64%) of women never sought help and never told anyone.

Table 1 Results of the household and individual interviews

Number of households, number of interviews with women and men, and response rates, according to residence, Meghalaya, 2019-20

	Resi	dence	_		
Result	Urban	Rural	Total		
Household interviews					
Households selected	1,188	8,979	10,167

na = Not applicable

¹ Nuclear households are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted, or fostered) with or without unrelated individuals. The remaining households are non-nuclear households.

² Protected dug well, protected spring, rainwater, community RO plant, tanker truck, cart with small tank, bottled water

³ Defined as drinking water from an improved source, provided either water is on the premises or round-trip collection time is 30 minutes or less. Includes safely managed drinking water, which is not shown separately.

⁴ Drinking water from an improved source, provided round-trip collection time is more than 30 minutes or is unknown.

⁵ Total may add to more than 100.0 because households may use more than one method of treatment

⁶ Appropriate water treatment methods are boiling, adding bleach/chlorine tablets, filtering, electronic purifying, and solar disinfection

⁷ Includes ventilated improved pit (VIP) latrine/biogas latrine, and twin pit/composting toilet

⁸ Facilities that would be considered improved if they were not shared by two or more households

⁹ Defined as use of improved facilities that are not shared with other households.

¹⁰ Defined as use of improved facilities shared by two or more households.

¹¹ Houses made from mud, thatch, or other low-quality materials are called *kachha* houses, houses that use partly low-quality and partly high-quality materials are called *semi-pucca* houses, and houses made with high quality materials throughout, including the floor, roof, and exterior walls, are called *pucca* houses.

¹² Electricity, LPG/natural gas, biogas

¹³ Includes coal/lignite, charcoal, wood, straw/shrubs/grass, agricultural crop waste, and dung cakes

¹⁴ Frequency of smoking by anyone inside the house

Table 5 Access to a toilet facility

Percentage of households having access to a toilet facility by selected background characteristics, according to residence, Meghalaya, 2019-20

Background characteristic	Urban	Rural	Total
Religion of household head			
Hindu	100.0	88.7	93.6
Muslim	*	98.4	98.6
Christian	99.5	96.1	96.8
Other	99.5	89.7	91.4
Caste/tribe of household head			
Scheduled caste	100.0	99.6	99.9
Scheduled tribe	99.5	95.0	95.9
Other backward class	*	100.0	100.0
Other	100.0	97.2	98.3
Total	99.6	95.2	96.2

Note: Includes households that have any type of toilet facility that household members usually use and households that do not use a toilet facility but report that they have access to a toilet facility. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed. Total includes households with household heads whose caste/tribe is not known, which are not shown separately.

Table 6 Access to a toilet facility by district

Percentage of households having access to a toilet facility by district, according to residence, Meghalaya, 2019-20

_	Residence						
District	Urban	Rural	Total				
East Garo Hills	100.0	99.9	99.9				
East Jaintia Hills	*	91.9	91.9

Table 17 Background characteristics of respondents—Continued

Percent distribution of women and men age 15-49 by selected background characteristics, Meghalaya, 2019-20

	Weighted percent		Number	Number of women		r of men
Background characteristic	Women	Men	Weighted	Unweighted	Weighted	Unweighted
Total age 15-49	100.0	100.0	13,089	13,089	1,703	1,708
Age 50-54	na	6.7	na	na	121	116
Total age 15-54	na	100.0	na	na	1,824	1,824
Employment status (past 12 months)						
Employed at any time	47.7	81.7	952	917	1,391	1,405
In agricultural occupation	5.4	39.0	108	92	664	711
In non-agricultural occupation	35.1	30.7	701	697	523	494
Don't know	7.1	12.0	143	128	204	200
Not employed	52.3	18.3	1,045	1,048	312	303
Total age 15-49	100.0	100.0	1,997	1,965	1,703	1,708
Age 50-54	na	6.7	na	na	121	116
Total age 15-54	na	100.0	na	na	1,824	1,824

 $na = Not \ applicable$ ¹ Refers to women/men who can read a whole sentence or part of a sentence and women/men who completed standard 9 or higher (who are assumed to be literate)

Table 18 Fertility trends

Age-specific and total fertility rates and crude birth rates for the 3 years preceding the survey from NFHS-5, NFHS-4, and NFHS-3, by residence, Meghalaya

	NFHS-5				NFHS-4		NFHS-3		
Age	Urban	Rural	Total	Urban	Rural	Total	Urban	Rural	Total
15-19	0.018	0.058	0.049	0.016	0.058	0.048	0.032	0.062	0.054
20-24	0.066	0.165	0.144	0.085	0.172	0.152	0.116	0.219	0.190
25-29	0.104	0.152	0.142	0.110	0.182	0.165	0.150	0.215	0.197
30-34	0.081	0.142	0.128	0.073	0.138	0.123	0.061	0.166	0.136
35-39	0.036	0.091	0.078	0.043	0.095	0.083	0.049	0.118	0.100
40-44	0.007	0.042	0.033	0.003	0.040	0.030	(0.023)	0.067	0.055
45-49	0.000	0.012	0.009	0.004	0.009	0.008	*	(0.028)	0.027
TFR (15-	1.57	2.21	2.01	1.67	2.47	2.04	2.20	4.20	2.00
49)	1.57	3.31	2.91	1.67	3.47	3.04	2.28	4.38	3.80
CBR	14.8	26.5	24.2	16.1	26.7	24.6	21.1	31.0	28.7

Note: Rates are for the period 1-36 months preceding the survey (approximately 2003-05 for NFHS-3, 2013-15 for NFHS-4, and 2017-19 for NFHS-5). Age-specific fertility rates are expressed per 1,000 women. Figures in parentheses are based on 125-249 unweighted women-years of exposure. An asterisk indicates that a figure is based on fewer than 125 unweighted women-years of exposure and has been suppressed.

TFR = Total fertility rate, expressed per woman

CBR = Crude birth rate, expressed per 1,000 population

Table 19 Fertility by background characteristics

Total fertility rate for the 3 years preceding the survey, percentage of women age 15-49 currently pregnant, mean number of children ever born to women age 40-49, and total wanted fertility by background characteristics, Meghalaya, 2019-20

Background characteristic	Total fertility rate	Percentage of women age 15-49 currently pregnant	Mean number of children ever born to women age 40-49	Total wanted fertility rate
	-			
Residence				
Urban	1.57	4.6	2.7	1.43

Note: If more than one method is used, only the most effective method is considered in this table.

IUD = Intrauterine device; PPIUD = Postpartum intrauterine device; LAM = Lactational amenorrhoea method na = Not available

Table 29 Current use of contraceptive methods by district

Percentage of currently married women age 15-49 years using any contraceptive method, any modern method, female sterilization, male sterilization, any modern spacing method, and any traditional method, according to district, Meghalaya, 2019-20

District	Any method	Any modern method	Female sterilization	Any modern spacing method ¹	Any traditional method ²	Number of women
East Garo Hills	37.0	35.8	4.4	31.3	1.2	502
East Jaintia Hills	33.6	24.0	9.2	14.8	9.7	354
East Khasi Hills	12.1	10.6	4.3	6.3	1.4	2,126
North Garo Hills	19.2	17.7	2.9	14.8	1.5	422
Ribhoi	33.1	19.7	6.3	13.4	13.4	692
South Garo Hills	37.6	33.3	3.8	29.5	4.3	352
South West Garo Hills	36.7	32.3	3.5	28.8	4.4	446
South West Khasi						
Hills	26.5	15.7	6.2	9.5	10.8	258
West Garo Hills	44.1	39.9	6.7	33.2	4.2	1,414
West Jaintia Hills	19.3	17.5	4.5	13.0	1.7	650
West Khasi Hills	26.3	15.3	9.3	6.0	11.0	809
Meghalaya	27.4	22.5	5.6	16.9	4.9	8,024

 $^{^{1}} Includes \ pill, IUD/PPIUD, injectables, male \ condom, female \ condom, emergency \ contraception, lactational \ amenorrhoea \ method \ (LAM), and other \ modern \ methods$

² Includes rhythm, withdrawal, and other traditional methods

Table 30 Contraceptive use by men at last sexual intercourse

Percent distribution of currently married men and sexually active unmarried men age 15-49 by contraceptive used the last time they had sex, according to type of partner and background characteristics, Meghalaya, 2019-20

Note: All information in this table is based on women's reports. Table includes all users of modern contraceptive methods regardless of their marital status. Figures in parentheses are based on 25-49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

IUD = Intrauterine device; PPIUD = Postpartum intrauterine device; AYUSH = Ayurveda, yoga and naturopathy, unani, siddha and homeopathy; UHC = Urban health centre; UHP = Urban health post; UFWC = Urban family welfare centre; CHC = Community health centre; PHC = Primary health centre; ANM = Auxiliary nurse midwife; ICDS = Integrated Child Development Services; ASHA = Accredited Social Health Activist; NGO = Nongovernmental organization; TBA = Traditional birth attendant

¹ Excludes standard days method, lactational amenorrhoea method (LAM), and "other" modern methods

Table 32 Informed choice

Among women who are current users of selected modern contraceptive methods who started the last episode of use within the 5 years preceding the survey, percentage who were informed about possible side effects or problems of that method, percentage who were informed about what to do if they experienced side effects, percentage who were ever told by a health or family planning worker about other methods of family planning they could use, and percentage who were informed of all three (Method Information Index) by method, according to residence, Meghalaya, 2019-20

Method	Percentage who were informed about side effects or problems of method used	Percentage who were informed about what to do if experienced side effects	Percentage who were informed by a health or family planning worker of other methods that could be used	Percentage who were informed about all three (Method Information Index)	Number of women

Total	67.3	57.4	71.2	55.1	848

Note: Table includes only the contraceptive methods separately shown in the table and excludes users who obtained their method from friends/relatives or husband. Figures in parentheses are based on 25-49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

IUD = Intrauterine device; PPIUD = Postpartum intrauterine device

¹ Among women who were sterilized in the 5 years preceding the survey

Table 33 Twelve-month contraceptive discontinuation rates

Among women age 15-49 who started an episode of contraceptive use within the 5 years preceding the survey, percentage of episodes discontinued within 12 months, by reason for discontinuation and specific method, Meghalaya, 2019-20

		_	_							
Method	Method failure	Desire to become pregnant	Other fertility related reason ¹	Side effects/health concerns	Wanted more effective method	Other method related reason ²	Other reason	Any reason ³	Switched to another method ⁴	Number of episodes of use ⁵
Pill	1.6	9.7	2.6	16.4	0.7	13.0	6.4	50.4	7.6	1,059
IUD or PPIUD	0.7	2.7	0.1	4.8	0.7	4.6	3.5	17.2	2.5	319
Injectables	(0.0)	(10.8)	(1.5)	(19.0)	(1.2)	(16.8)	(5.0)	(54.3)	(7.1)	144
Condom/Nirodh	5.1	5.8	16.6	5.3	2.4	26.5	9.9	71.7	9.5	562
Rhythm	8.1	24.3	16.2	0.3	2.0	0.9	11.5	63.3	5.5	286
Withdrawal	3.6	20.8	9.8	1.5	1.7	3.2	12.9	53.6	4.7	648
All modern spacing										
methods ⁶	2.2	7.5	6.0	11.5	1.2	15.6	6.8	50.8	7.6	2,146
All spacing methods ⁷	3.1	11.9	7.7	8.3	1.4	11.6	8.5	52.6	6.8	3,086
All methods	2.9	11.3	7.4	7.9	1.4	11.1	8.1	50.2	6.5	3,236

Note: Figures are based on life table calculations using information on episodes of contraceptive use that occurred 3-62 months preceding the survey. All methods includes users of female sterilizations, male sterilizations, and other methods, which are not shown separately. Figures in parentheses are based on 25-49 unweighted cases.

IUD = Intrauterine device; PPIUD = Postpartum intrauterine device

¹ Includes infrequent sex/husband away, difficult to get pregnant/menopausal, and marital dissolution/separation

² Includes lack of access/too far, costs too much, and inconvenient to use

³ Reasons for discontinuation are mutually exclusive and add to the total given in this column

⁴ The episodes of use included in this column are a subset of the discontinued episodes included in the discontinuation rate. A woman is considered to have switched to another method if she used a different method in the month following discontinuation or if she gave "wanted a more effective method" as the reason for discontinuation and started another method within 2 months of discontinuation.

⁵ All episodes of use that occurred within the 5 years preceding the survey are included. Number of episodes of use includes both episodes of use that were discontinued during the period of observation and episodes of use that were not discontinued during the period of observation

⁶ Includes pill, IUD/PPIUD, injectables, male condom, female condom, lactational amenorrhoea method (LAM), diaphragm, foam/jelly, and other modern spacing methods

⁷ Includes pill, IUD/PPIUD, injectables, male condom, female condom, lactational amenorrhoea method (LAM), diaphragm, foam/jelly, rhythm, withdrawal, and other modern spacing and traditional methods

Table 34 Men's contraception-related perceptions and knowledge

Percentage of men age 15-49 who agree with two specific statements about women and contraception, and percent distribution of men according to their belief about the efficacy of condoms in preventing pregnancy, by background characteristics, Meghalaya, 2019-20

Don't know	*	*	*	*	*	*	*	*	*	15	0.0	0.0
Total	18.3	8.6	26.9	13.9	13.5	27.4	32.2	22.1	54.3	8,024	50.4	41.4

Note: Numbers in this table correspond to the revised definition of unmet need described in Bradley et al., 2012, Revising Unmet Need for Family Planning, DHS Analytical Studies No. 25, ICF International, Calverton, Maryland, USA. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

¹ Total demand is the sum of unmet need and met need

² Percentage of demand satisfied is met need divided by total demand

³ Modern methods include female sterilization, male sterilization, pill, IUD/PPIUD, injectables, male condom, female condom, standard days method, diaphragm, foam/jelly, lactational amenorrhoea method (LAM), other modern methods

Table 36 Unmet need for family planning by district

Percentage of currently married women age 15-49 with unmet need for family planning by district, Meghalaya, 2019-20, and total for NFHS-4 $\,$

District	Total unmet need	Unmet need for spacing	Unmet need for limiting	Number of women
East Garo Hills	21.0	12.4	8.6	502
East Jaintia Hills	26.0	20.1	5.9	354
East Khasi Hills	33.0	25.2	7.9	2,126
North Garo Hills	25.2	12.9	12.3	422

Note: Figures in parentheses are based on 250-499 unweighted person-years of exposure to the risk of death. An asterisk indicates that a figure is based on fewer than 250 unweighted person-years of exposure to the risk of death and has been suppressed. Total includes children with mother's age at birth 40-49, Muslim children, children belonging to scheduled caste or other backward class, or whose caste/tribe is not known, who are not shown separately.

¹ Computed as the difference between the infant and neonatal mortality rates

² Excludes first-order births

³ Not Hindu, Christian, or Muslim

⁴Not belonging to scheduled caste, scheduled tribe, or other backward class

Table 43 High-risk fertility behaviour

Percent distribution of children born in the 5 years preceding the survey by category of elevated risk of mortality and the risk ratio, and percent distribution of currently married women by category of risk if they were to conceive a child at the time of the survey, Meghalaya, 2019-20

	Births in the preceding the	-	Percentage - of currently
Risk category	Percentage of births	Risk ratio	married women ¹
Not in any high-risk category	26.6	1.0	28.9 ^a
Unavoidable risk category			
First order births between ages 18 and 34 years	22.7	1.5	5.6
Single high-risk category			
Mother's age <18	2.5	5.8	0.1
Mother's age >34	2.7	1.4	14.5
Birth interval <24 months	10.3	2.3	7.0
Birth order >3	16.5	2.0	10.2
Subtotal	32.0	2.4	31.8
Multiple high-risk category			
Mother's age <18 and birth interval <24 months ²	0.2	*	0.0
Mother's age >34 and birth interval <24 months	0.3	*	0.4
Mother's age >34 and birth order >3	8.7	2.4	24.3
Mother's age >34 and birth interval <24 months			
and birth order >3	2.7	4.9	3.3
Birth interval <24 months and birth order >3	6.8	3.1	5.7
Subtotal	18.7	3.1	33.7
In any avoidable high-risk category	50.8	2.6	65.5
Total	100.0	na	100.0
Number of births	6,267	na	8,024

Note: Risk ratio is the ratio of the proportion dead among births in a specific high-risk category to the proportion dead among births not in any high-risk category. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

na = Not applicable

¹ Women are assigned to risk categories according to the status they would have at the birth of a child if they were to conceive at the time of the survey: current age less than 17 years and 3 months or greater than 34 years and 2 months, latest birth less than 15 months ago, or latest birth of order 3 or higher ² Includes the category age <18 and birth order >3

^a Includes sterilized women

Table 44 Antenatal care

Percent distribution of women who had a live birth in the 5 years preceding the survey by antenatal care (ANC) provider during pregnancy for the most recent live birth and percentage receiving ANC from a skilled provider, according to background characteristics, Meghalaya, 2019-20

Note: Figures in parentheses are based on 25-49 unweighted cases. Total includes information on births of children whose caste/tribe is not known, which is not shown separately.

¹ Includes newborns who received a health check after the first week.

² Includes nongovernmental organization or trust hospital/clinic

³ Includes missing

Table 57 Trends in maternal care indicators

Maternal care indicators for births during the 5 years preceding the survey by residence, NFHS-5 and NFHS-4, Meghalaya

Indicator	NFHS-5 (2019-20)	NFHS-4 (2015-16)
URBAN	, ,	
Percentage who received antenatal care ¹	86.2	93.3
Percentage who had at least four antenatal care visits ¹	68.0	71.3
Percentage who received antenatal care within the first trimester of pregnancy ¹	60.3	68.2
Percentage of births delivered in a health facility ²	82.3	88.1
Percentage of deliveries assisted by health personnel ^{2,3}	82.3	90.8
RURAL		
Percentage who received antenatal care ¹	82.9	83.3
Percentage who had at least four antenatal care visits ¹	52.0	46.3
Percentage who received antenatal care within the first trimester of pregnancy ¹	51.3	50.7
Percentage of births delivered in a health facility ²	55.1	45.7
Percentage of deliveries assisted by health personnel ^{2,3}	62.0	48.1
TOTAL		
Percentage who received antenatal care ¹	83.3	84.7
Percentage who had at least four antenatal care visits ¹	54.0	50.0
Percentage who received antenatal care within the first trimester of pregnancy ¹	52.5	53.3
Percentage of births delivered in a health facility ²	58.5	51.3
Percentage of deliveries assisted by health personnel ^{2,3}	64.6	53.8

¹ Based on the last birth to women in the 5 years preceding the survey
² Based on all births in the 5 years preceding the survey
³ Doctor, auxiliary nurse midwife (ANM), nurse, midwife, lady health visitor (LHV), or other health personnel

Table 58 Male involvement in maternal care: Men's report

Among men age 15-49 whose youngest living child was age 0-35 months, percentage for whom the mother of the child received antenatal care (ANC), percentage who were present for at least one antenatal check-up, percentage who were told by a health provider or worker at any time during the pregnancy about specific signs of pregnancy complications, percentage to whom a health provider or worker spoke about specific aspects of maternal care at any time during the pregnancy, and percentage whose youngest child was delivered in a health facility, and among men with a child age 0-35 months whose youngest living child was not delivered in a health facility, percentage who were given specific home delivery related information, by residence, Meghalaya, 2019-20

Antenatal and delivery care information	Urban	Rural	Total
Percentage of men for whom the child's mother received antenatal care	(91.7)	83.7	84.8
Percentage of men who were present at any antenatal care visit	(58.5)	40.8	43.3
Percentage who were told by a health provider or worker about the			
following signs of pregnancy complications:	(44.0)	4= 0	40.0
Vaginal bleeding	(61.9)	47.0	49.2
Convulsions	(61.8)	48.8	50.7
Prolonged labour	(61.6)	52.1	53.4
Severe abdominal pain	(68.7)	58.1	59.6
High blood pressure	(66.8)	62.7	63.3
Percentage ever told what to do if the child's mother had any pregnancy			
complications	(48.5)	52.4	51.9
Percentage whose youngest child age 0-35 months was delivered in a	(1010)		
health facility	(99.4)	58.2	64.1
Percentage to whom a health provider or worker spoke about the			
following aspects of maternal care:			
The importance of delivering the baby in a health facility	(63.0)	74.6	73.0
The importance of derivering the baby in a heath facility The importance of proper nutrition for the mother during pregnancy	(62.0)	77.6	75.4
Family planning or delaying his next child	(54.6)	62.4	61.3
ranning planning of delaying his next child	(34.0)	02.4	01.5
Number of men with a youngest child age 0-35 months	55	330	385
Among men whose last child age 0-35 months was not delivered in a			
health facility, percentage who were told the importance of:			
Cord care	*	30.9	30.8
Breastfeeding the baby immediately after delivery	*	67.6	67.4
Keeping the baby warm immediately after birth	*	66.2	66.3
Number of men whose youngest child age 0-35 months was not delivered in a health facility	0	138	138
	•		

Note: Figures in parentheses are based on 25-49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

Table 59 Vaccinations by background characteristics

Percentage of children age 12-23 months who received specific vaccines at any time before the survey (according to a vaccination card or the mother's report), and percentage with a vaccination card seen by the interviewer, by background characteristics, Meghalaya, 2019-20, and total for NFHS-4

Note: Children are considered to have received the vaccine if it was either written on the child's vaccination card or reported by the mother. For children whose vaccination information is based on the mother's report, the date of vaccination is not collected. The proportions of vaccinations given during the first year of life are assumed to be the same as for children with a written record of vaccination. Figures in parentheses are based on 25-49 unweighted cases. Total includes Muslim children, children belonging to scheduled caste or other backward class or whose caste/tribe is not known, who are not shown separately.

na = Not available

¹ Hepatitis B 0 is the hepatitis vaccination given at birth. There is no Penta 0 vaccine.

² Polio 0 is the polio vaccination given at birth

³ BCG, MCV/Measles/MMR/MR, and three doses each of DPT/Penta and polio vaccine (excluding polio vaccine given at birth)

⁴ BCG, MCV/Measles/MMR/MR, four doses of hepatitis B, and three doses each of DPT/Penta and polio vaccine (excluding polio vaccine given at birth)

⁵ Not Hindu, Christian, or Muslim

⁶ Not belonging to scheduled caste, scheduled tribe, or other backward class

Table 60 Vaccinations by district

Percentage of children age 12-23 months who received specific vaccines at any time before the survey (according to a vaccination card or the mother's report), and percentage with a vaccination card seen by the interviewer, by district, Meghalaya, 2019-20

Note: Table is based on children who stayed in the household the night before the interview. Each of the indices is expressed in standard deviation (SD) units from the median of the WHO Child Growth Standards. Table is based on children with valid dates of birth (month and year) and valid measurement of both height and weight. Figures in parentheses are based on 25-49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed. Total includes children whose mother's nutritional status is missing and children whose caste/tribe is not known, who are not shown separately.

BMI = Body mass index

¹ Recumbent length is measured for children under age 2; standing height is measured for all other children

² Includes children who are below -3 standard deviations (SD) from the WHO Child Growth Standards population median

³ Excludes children whose mothers were not interviewed

⁴ First-born twins (triplets, etc.) are counted as first births because they do not have a previous birth interval

⁵ For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the household schedule.

⁶ Excludes children whose mothers were not weighed and measured, children whose mothers were not interviewed, and children whose mothers are pregnant or gave birth within the preceding 2 months. Mother's nutritional status in terms of BMI (Body Mass Index) is presented in Table 78.

Table 68 Initial breastfeeding

Among last-born children who were born in the age 2 years preceding the survey, percentage who were ever breastfed, and percentages who started breastfeeding within 1 hour and 1 day of birth, and among last-born children born in the age 2 years preceding the survey who were ever breastfed, percentage who received a prelacteal feed in the first 3 days after birth, by background characteristics, Meghalaya, 2019-20

		Among last-born in the past				children born in the were ever breastfed:
Background characteristic	Percentage ever breastfed	Percentage who started breastfeeding within 1 hour of birth	Percentage who started breastfeeding within 1 day of birth ¹	Number of last-born children	Percentage who received a prelacteal feed ²	Number of last-born ever breastfed children

Note: Table is based on last-born children born in the 2 years preceding the survey regardless of whether the children are living or dead at the time of the interview. Total includes Muslim children, children belonging to scheduled caste or other backward class or whose caste/tribe is not known, and children delivered at an other place of delivery, who are not shown separately.

TBA = Traditional birth attendant

¹ Includes children who started breastfeeding within 1 hour of birth

² Children given something other than breast milk during the first 3 days of life

³ Doctor, nurse, midwife, auxiliary nurse midwife, lady health visitor, or other health personnel

⁴Not Hindu, Christian, or Muslim

⁵ Not belonging to scheduled caste, scheduled tribe, or other backward class

Table 69 Breastfeeding status by age

Percent distribution of youngest children under age 2 years living with the mother by breastfeeding status and percentage currently breastfeeding, and percentage of all children under age 2 years using a bottle with a nipple, according to age in months, Meghalaya, 2019-20

			I	Breastfeeding	g and con	suming:			Number of youngest children under	Percentage	Number of
Age in months	Not breastfeeding	Exclusively breastfed	Plain water only	Non-milk liquids ¹	Other milk	Complementary foods	Total	Percentage currently breastfeeding	age 2 years living with the mother	using a bottle with a nipple	all children under age 2 years

9-11	6.2	2.2	8.7	5.7	2.5	74.7	100.0	93.8	279	30.2	281
12-17	21.2	1.9	3.0	0.6	0.3	73.0	100.0	78.8	491	25.0	508
18-23	43.2	0.9	1.5	0.9	0.5	53.0	100.0	56.8	502	27.8	567
0-3	2.5	49.9	21.1	3.2	10.6	12.7	100.0	97.5	423	17.2	426
0-5	3.0	42.9	22.8	2.8	9.5	18.9	100.0	97.0	586	18.5	590
6-9	3.2	9.0	15.3	3.0	3.9	65.5	100.0	96.8	368	25.3	373
12-15	19.2	1.9	3.0	0.8	0.2	75.0	100.0	80.8	329	26.3	336
12-23	32.3	1.4	2.2	0.8	0.4	62.9	100.0	67.7	993	26.5	1,076
20-23	49.2	0.7	0.5	0.3	0.7	48.6	100.0	50.8	298	27.1	344

Note: Breastfeeding status refers to a "24-hour" period (yesterday during the day or at night). Children who are classified as breastfeeding and consuming plain water only consumed no liquid or solid supplements. The categories of not breastfeeding, exclusively breastfeed, breastfeeding and consuming plain water, non-milk liquids, other milk, and complementary foods (solids and semi-solids) are hierarchical and mutually exclusive, and their percentages add to 100 percent. Thus children who receive breast milk and non-milk liquids and who do not receive other milk and who do not receive complementary foods are classified in the non-milk liquid category even though they may also get plain water. Any children who get complementary food are classified in that category as long as they are breastfeeding as well.

¹ Non-milk liquids include juice, juice drinks, clear broth, and other liquids.

Table 70 Median duration of breastfeeding and infant and young child feeding (IYCF) practices

Median duration of any breastfeeding, exclusive breastfeeding, and predominant breastfeeding among last-born children born in the 3 years preceding the survey, by background characteristics, Meghalaya, 2019-20

Median	duration (months) of breastfeeding among	
last-	born children born in the past 3 years ¹	

	last	t-born children bor	n in the past 3 years	1

Christian	21.8	2.3	4.9	2,639
Other ³	(22.2)	*	3.9	220
Total	22.0	2.2	4.8	3,003

Note: Median and mean durations are based on breastfeeding status of the child at the time of the survey (current status). Includes living and deceased children. Figures in parentheses are based on 25-49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed. Total includes information on children belonging to Hindu or Muslim religions, who are not shown separately.

a = Omitted because the smoothed percentage is below 50 percent in the first age cell (<2 months) and therefore the median cannot be calculated

¹ For last-born children under age 24 months who live with the mother and are breastfeeding, information to determine exclusive and predominant breastfeeding comes from a 24-hour dietary recall. Tabulations assume that last-born children age 24 months or older who live with the mother and are breastfeeding are neither exclusively nor predominantly breastfed. It is assumed that last-born children not currently living with the mother and all non-last-born children are not currently breastfeeding.

² Either exclusively breastfed or received breast milk and plain water, and/or non-milk liquids only

³ Not Hindu, Christian, or Muslim

Table 71 Minimum acceptable diet

Percentage of youngest children age 6-23 months living with their mother who are fed a minimum acceptable diet based on breastfeeding status, number of food groups, and times they are fed during the day or night preceding the survey, according to background characteristics, Meghalaya, 2019-20

Table 71 Minimum acceptable diet—Continued

Percentage of youngest children age 6-23 months living with their mother who are fed a minimum acceptable diet based on breastfeeding status, number of food groups, and times they are fed during the day or night preceding the survey, according to background characteristics, Meghalaya, 2019-20

	Among		nildren 6-23 age fed:	months,	Amo	-	astfed childr ercentage fe		nths,	Among all children 6-23 months, percentage fed:				
Background characteristic	dietary	Minimum meal frequency ²	acceptable	Number of breastfed children	Minimum milk feeding frequency ⁴	Minimum dietary diversity ¹	Minimum meal frequency ⁵	Minimum acceptable diet ⁶	Number of non- breastfed children	Breast milk, milk, or milk products ⁷	Minimum dietary diversity ¹	Minimum meal frequency ⁸	Minimum acceptable diet ⁹	Number of all children
Caste/tribe Scheduled tribe Other ¹¹	60.2 52.1	47.1 47.0	29.9 15.7	1,142 46	46.7 *	68.2	55.0	30.3	325 12	88.2 87.0	56.0 44.9	48.8 52.4	30.0 16.9	1,467 58
Total	59.6	46.5	29.0	1,209	45.6	67.5	54.7	29.4	344	88.0	55.0	48.3	29.1	1,552

Note: Figures in parentheses are based on 25-49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed. Total includes Muslim children and children belonging to scheduled caste or other backward class or whose caste/tribe is not known, who are not shown separately.

¹ Children received foods from four or more of the following food groups: a. breast milk b. infant formula, milk other than breast milk, cheese or yogurt or other milk products; c. foods made from grains or roots, including porridge or gruel, fortified baby food made from grains; d. vitamin A-rich fruits and vegetables; e. other fruits and vegetables; f. eggs; g. meat, poultry, fish, shellfish, or organ meats; h. beans, peas, lentils, or nuts ² For breastfed children, minimum meal frequency is receiving solid or semi-solid food at least twice a day for infants 6-8 months and at least three times a day for children 9-23 months

³ Breastfed children age 6-23 months are considered to be fed a minimum acceptable diet if they are fed the minimum dietary diversity as described in footnote 1 and the minimum meal frequency as described in footnote 2

⁴ Includes two or more feedings of commercial infant formula; fresh, tinned and powdered animal milk; and yogurt

⁵ For nonbreastfed children age 6-23 months, minimum meal frequency is receiving solid or semi-solid food or milk feeds at least four times a day. At least one of the feeds must be a solid or semi-solid food.

⁶ Nonbreastfed children age 6-23 months are considered to be fed a minimum acceptable diet if they receive other milk products at least twice a day, receive the minimum meal frequency as described in footnote 5, and receive solid or semi-solid foods from at least four food groups not including the milk or milk products food group

⁷ Breastfeeding, or not breastfeeding and receiving two or more feedings of commercial infant formula, fresh, tinned, and powdered animal milk, and yogurt

⁸ Children are fed the minimum recommended number of times per day according to their age and breastfeeding status as described in footnotes 2 and 5

⁹ Children age 6-23 months are considered to be fed a minimum acceptable diet if they receive breast milk, other milk or milk products as described in footnote 7, are fed the minimum dietary diversity as described in footnote 1, and are fed the minimum meal frequency as described in footnotes 2 and 5

¹⁰ Not Hindu, Christian, or Muslim

¹¹ Not belonging to scheduled caste, scheduled tribe, or other backward class

Table 72 Child feeding practices and nutritional status of children by district

Among last-born children who were born in the 2 years preceding the survey, percentage who started breastfeeding within 1 hour of birth, percentage of youngest children under age 6 months living with the mother who are exclusively breastfed, and percentage of children under age 5 years classified as malnourished according to three anthropometric indices of nutritional status: height-for-age, weight-for-height, and weight-for-age, by district, Meghalaya, 2019-20

Table 73 Prevalence of anaemia in children—Continued

Percentage of children age 6-59 months classified as having anaemia, by background characteristics, Meghalaya, 2019-20 and total for NFHS-4

	Anaemia s	status by haemoglob	oin level		
Background characteristic	Mild (10.0-10.9 g/dl)	Moderate (7.0-9.9 g/dl)	Severe (<7.0 g/dl)	Any anaemia (<11.0 g/dl)	Number of children
Mother's anaemia status ³					
Not anaemic	21.0	14.5	0.9	36.4	1,855
Mildly anaemic	25.2	21.9	1.3	48.4	956
Moderately/severely anaemic	28.6	24.8	0.5	53.9	1,455
Total	24.5	19.7	0.8	45.1	4,318
NFHS-4 (2015-16)	24.5	15.8	0.4	40.7	3,548

Note: Table is based on children who stayed in the household the night before the interview and who were tested for anaemia. Prevalence of anaemia, based on haemoglobin levels, is adjusted for altitude using the CDC formula (Centers for Disease Control (CDC). 1998. Recommendations to prevent and control iron deficiency in the United States. *Morbidity and Mortality Weekly Report* 47 (RR-3): 1-29). Haemoglobin levels shown in grams per decilitre (g/dl). Figures in parentheses are based on 25-49 unweighted cases. Total includes children belonging to other backward class or whose caste/tribe is not known, who are not shown separately.

¹ Excludes children whose mothers were not interviewed

 $^{^2}$ For mothers who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the household schedule.

³ Mildly anaemic is 10.0-11.9 g/dl for non-pregnant women and 10.0-10.9 g/dl for pregnant women. Moderately/severely anaemic is <10.0 g/dl. Adjusted for altitude and for smoking status. Excludes children whose mother's anaemia status is not known.

⁴ Not belonging to scheduled caste, scheduled tribe, or other backward class

Table 74 Micronutrient intake among children

Percentage of youngest children age 6-23 months living with their mother who consumed vitamin A-rich and iron-rich foods in the day or night preceding the survey, percentage of children age 6-23 months who were given multiple micronutrient powder in the last 7 days, who were given iron supplements in the last 7 days, and who were given deworming medication in the last 6 months; percentage of children age 9-35 months who were given vitamin A supplements in the 6 months preceding the survey; and percentage of children age 6-59 months who live in households using iodized salt, by background characteristics, Meghalaya, 2019-20, and total from NFHS-4

Total	14.2	51.6	38.5	7.4	1.8	0.7	100.0	2.3	12,557

Note: Total includes women who don't know their caste/tribe, who are not shown separately.

SBP = Systolic blood pressure; DBP = Diastolic blood pressure

¹ A woman is classified as having hypertension if she has SBP ≥140 mmHg or DBP ≥90 mmHg at the time of the survey, or she is currently taking antihypertensive medication to control blood pressure. The term hypertension as used in this table is not meant to be a clinical diagnosis of the disease, but rather to provide an indication of the disease burden in the population at the time of the survey.

<u>Table 92.2 Blood pressure status: Men</u>

Total age 15-54	19.4	34.9	47.6	15.2	1.8	0.5	100.0	0.7	1,687

Note: Figures in parentheses are based on 25-49 unweighted cases. Total includes men belonging to scheduled caste or other backward class or men who don't know their caste/tribe, who are not shown separately.

SBP = Systolic blood pressure; DBP = Diastolic blood pressure

¹ A man is classified as having hypertension if he has \overrightarrow{SBP} ≥140 mmHg or \overrightarrow{DBP} ≥90 mmHg at time of survey, or he is currently taking antihypertensive medication to control blood pressure. The term hypertension as used in this table is not meant to be a clinical diagnosis of the disease, but rather to provide an indication of the disease burden in the population at the time of the survey.

² Not belonging to scheduled caste, scheduled tribe, or other backward class

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women. Figures in parentheses are based on 25-49 unweighted cases. Total includes women age 18-19 years, women belonging to scheduled caste or other backward class, or who don't know their caste/tribe, who are not shown separately.

¹ Currently married women only

² Nuclear households are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted, or fostered) with or without unrelated individuals. The remaining households are non-nuclear households.

³ Not belonging to scheduled caste, scheduled tribe, or other backward class

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women. Figures in parentheses are based on 25-49 unweighted cases. Total includes women whose husband drinks but never gets drunk, who are not shown separately.

¹ Currently married women only

² Behaviours include: Is jealous or angry if she talks to other men, frequently accuses her of being unfaithful, does not permit her to meet her female friends, tries to limit her contact with her family, insists on knowing where she is at all times, and does not trust her with any money

³ Currently married women only. Decisions included are decisions about own health care, major household purchases, and visits to her family or relatives.

⁴ Peacens given for which wife besting is justified included the good out without telling him she product the house or children she groups with him she

⁴ Reasons given for which wife beating is justified include: she goes out without telling him, she neglects the house or children, she argues with him, she refuses to have sexual intercourse with him, she doesn't cook properly, he suspects she is unfaithful, and she shows disrespect for in-laws

⁵ Reasons given for refusing to have sexual intercourse with husband include: she knows her husband has a sexually transmitted disease, she knows her husband has sex with other women, and she is tired or not in the mood

Table 109 Injuries to women due to spousal violence

Percentage of ever-married women age 18-49 who have experienced spousal violence by types of injuries resulting from what their husband did to them, the type of violence, and whether they have experienced the violence ever and in the 12 months preceding the survey, Meghalaya, 2019-20

Type of spousal violence experienced	Cuts, bruises, or aches	Severe burns	Eye injuries, sprains, dislocations, or minor burns	Deep wounds, broken bones, broken teeth, or any other serious injury	Any of these injuries	Number of ever-married women

nc = No cases

Women can report more than one source from which they sought help.

APPENDIX

ESTIMATES OF SAMPLING ERRORS

The estimates from a sample survey are affected by two types of errors: (1) non-sampling errors, and (2) sampling errors. Non-sampling errors are the results of mistakes made in implementing data collection and data processing, such as failure to locate and interview the correct household, misunderstanding of the questions on the part of either the interviewer or the respondent, and data entry errors. Although numerous efforts were made during the implementation of the fifth National Family Health Survey (NFHS-5) to minimize this type of error, non-sampling errors are impossible to avoid and difficult to evaluate statistically.

Sampling errors, on the other hand, can be evaluated statistically. The sample of respondents selected in NFHS-5 is only one of many samples that could have been selected from the same population, using the same design and expected sample size. Each of these samples would yield results that differ somewhat from the results of the actual sample selected. Sampling errors are a measure of the variability among all possible samples. Although the degree of variability is not known exactly, it can be estimated from the survey results.

A sampling error is usually measured in terms of the *standard error* for a particular statistic (mean, percentage, etc.), which is the square root of the variance. The standard error can be used to calculate confidence intervals within which the true value for the population can reasonably be assumed to fall. For example, for any given statistic calculated from a sample survey, the value of that statistic will fall within a range of plus or minus two times the standard error of that statistic in 95 percent of all possible samples of identical size and design.

If the sample of respondents had been selected as a simple random sample, it would have been possible to use straightforward formulas for calculating sampling errors. However, the NFHS-5 sample is the result of a multi-stage stratified design, and, consequently, it was necessary to use more complex formulae. The computer software used to calculate sampling errors for NFHS-5 is programmed in SAS. This procedure uses the Taylor linearization method for variance estimation for survey estimates that are means or proportions. The Jackknife repeated replication method is used for variance estimation of more complex statistics such as total fertility rates and child mortality rates.

The Taylor linearization method treats any proportion or mean as a ratio estimate, r = y/x, where y represents the total sample value for variable y, and x represents the total number of cases in the group or subgroup under consideration. The variance of r is computed using the formula given below, with the standard error being the square root of the variance:

$$SE^{2}(r) = var(r) = \frac{1 - f}{x^{2}} \sum_{h=1}^{H} \left[\frac{m_{h}}{m_{h} - 1} \left(\sum_{i=1}^{m_{h}} z_{hi}^{2} - \frac{z_{h}^{2}}{m_{h}} \right) \right]$$

in which

$$z_{hi} = y_{hi} - rx_{hi}$$
, and $z_h = y_h - rx_h$

where h represents the stratum, which varies from 1 to H,

 m_h is the total number of clusters selected in the h^{th} stratum,

 y_{hi} is the sum of the weighted values of variable y in the i^{th} cluster in the h^{th} stratum,

 x_{hi} is the sum of the weighted number of cases in the i^{th} cluster in the h^{th} stratum, and is the overall sampling fraction, which is so small that it is ignored.

The Jackknife repeated replication method derives estimates of complex rates from each of several replications of the parent sample, and calculates standard errors for these estimates using simple formulae. Each replication considers *all but one* cluster in the calculation of the estimates. Pseudo-independent replications are thus created. In the NFHS-5 sample for Meghalaya, there were 462 clusters. Hence, 462 replications were created. The variance of a rate *r* is calculated as follows:

$$SE^{2}(r) = var(r) = \frac{1}{k(k-1)} \sum_{i=1}^{k} (r_{i} - r)^{2}$$

in which

$$r_i = kr - (k-1)r_{(i)}$$

where r is the estimate computed from the full sample of 462 clusters,

 $r_{(i)}$ is the estimate computed from the reduced sample of 461 clusters (i^{th} cluster excluded), and

k is the total number of clusters.

In addition to the standard error, the design effect (DEFT) for each estimate is computed, which is defined as the ratio between the standard error using the given sample design and the standard error that would result if a simple random sample had been used. A DEFT value of 1.0 indicates that the sample design is as efficient as a simple random sample, while a value greater than 1.0 indicates the increase in the sampling error due to the use of a more complex and less statistically efficient design. The relative standard error (SE/R) and confidence limits (R±2SE) for each estimate are also computed.

Sampling errors for NFHS-5 are calculated for selected variables considered to be of primary interest. The results are presented in this appendix for Meghalaya as a whole and for the urban and rural areas of the state. For each variable, the type of statistic (mean, proportion, rate, or ratio) and the base population are given in Table A.1. Tables A.2-A4 present the total, urban, and rural values of the statistic (R), their standard errors (SE), the number of unweighted (N) and weighted (WN) cases, the design effect (DEFT), the relative standard error (SE/R), and the 95 percent confidence limits (R±2SE) for each variable. The DEFT is considered undefined when the standard error for a simple random sample is zero (when the estimate is close to 0 or 1).

Variable	Estimate	Base population
