MESSAGE

DR. RAJIV KUMAR

Vice Chairperson

National Institution for Transforming India
Government of India

The Sustainable Development Goals framework, adopted by 193 countries in 2015, has redefined development policies, government priorities, and metrics for measuring development progress across the world. The SDG framework, with seventeen Global Goals and 169 targets, is significantly wider in scope and scale relative to the Millennium Development Goals, its predecessor. The expansion of scope includes the significant development of recognising the need to address poverty in all its forms and dimensions. This has been articulated in the SDG framework through target 1.2 – which is aimed at reducing “at least by half the proportion of men, women and children of all ages living in poverty in all its dimensions according to national definitions”. The development of the National Multidimensional Poverty Index of India is an important contribution towards instituting a public policy tool which monitors multidimensional poverty, informs evidence-based and focused interventions, thereby ensuring that no one is left behind.

India’s national MPI measure uses the globally accepted and robust methodology developed by the Oxford Poverty and Human Development Initiative (OPHI) and the United Nations Development Programme (UNDP), who have been key partners in ensuring the public policy utility and technical rigour of the Index. Importantly, as a measure of multidimensional poverty, it captures multiple and simultaneous deprivation faced by households. This report presents an in-depth analysis of the headcount ratio and intensity of multidimensional poverty at the national, State/UT, and district levels. I am certain that the results and findings of this baseline edition of the index will be of great relevance and interest to policy makers and administrators in States and districts, researchers and scholars, and the wider public.

This baseline report of India’s first ever national MPI measure is based on the reference period of 2015-16 of the National Family Health Survey (NFHS). The national MPI measure has been constructed by utilising twelve key components which cover areas such as health and nutrition, education and standard of living.

It has been envisaged as a comprehensive tool to expedite goal-oriented action to measure multi-dimensional poverty and steer its systematic eradication. Since the data reference period of NFHS 2015-16, India has made remarkable strides through flagship programmatic interventions in housing, electricity, sanitation, drinking water, and cooking fuel, among others. Apart from building infrastructure and ensuring basic services, focused initiatives to improve health and nutritional outcomes have been undertaken expeditiously during this period. The baseline report will be updated upon the release of the NFHS-5 (2019-20) dataset. I am confident that India’s multisectoral approach to address poverty and the impact of the flagship programmes and schemes will be reflected in that edition, thereby improving the national MPI score further.

I congratulate Shri Amitabh Kant, CEO, NITI Aayog, for encouraging the SDG team at NITI Aayog, led by Ms. Sanyukta Samaddar, Adviser, to develop India’s inaugural Multidimensional Poverty Index. My compliments and sincere thanks to the officials of State Governments, UTs, Union ministries, OPHI and UNDP, who have contributed towards this report.

MESSAGE

AMITABH KANT

Chief Executive Officer

National Institution for Transforming India
Government of India

The year 2021 marks the sixth anniversary of the adoption of the Sustainable Development Goals which envisages to end poverty in all its forms everywhere. Steered by the Government of India's Global Indices for Reforms and Growth (GIRG) initiative, the National Multidimensional Poverty Index (MPI) for India is aimed at leveraging the monitoring mechanism and methodology of the globally recognised MPI to rigorously benchmark national and subnational performance and drive programmatic actions and reforms.

India's national MPI captures multiple and simultaneous deprivations faced by households across the three macro dimensions of health, education and living standards. It highlights the need for a whole-of-government approach towards addressing poverty and its multidimensionality. This multi-sectoral approach must be horizontally and vertically integrated across all levels of governance.

Estimates of national MPI headcount ratio and intensity have been furnished not only for the country and States but also for all the districts, which is a unique feature of this report. This will not only enable the analysis of comparative and relative performance among States and UTs but also among the districts of a State. This assumes salience given the federal structure of the country and the importance of the involvement of district administrations for effective implementation of interventions and schemes.

As a multidimensional poverty measure and a policy tool, this inaugural baseline Report provides us with important insights into the degree of success of multi-sectoral interventions to address various aspects of poverty. With the release of the National Family Health Survey 2019-20, the subsequent update of the Report will capture the remarkable strides the country has taken to improve the lives of households across these multifaceted parameters.

Simultaneously, under the GIRG initiative, reform areas and actions are being formulated to utilise the insights made available through the Index to ramp up our efforts further to aggressively and systematically eradicate poverty. My appreciation goes to the Union Ministries and State/UT Governments, and all officials who have been engaging with us in this endeavour. I also compliment our technical partners, Oxford Poverty and Human Development Initiative (OPHI) and the United Nations Development Programme (UNDP), for their support.

I congratulate the SDG team at NITI Aayog led by Ms. Sanyukta Samaddar, Adviser, who has been steering our overall national MPI efforts in bringing out our first national Multidimensional Poverty Index & Dashboard and our continuous engagement with key stakeholders, the Governments of States and UTs and Union Ministries through her commendable leadership.

MESSAGE

PEDRO CONCEIÇÃO

Director

Human Development Report Office
United Nations Development Programme

I congratulate the Government of India, NITI Aayog, and my UNDP colleagues on the launch of India's first National Multidimensional Poverty Index: Baseline Report & Dashboard.

Since its development in 2010, the Multidimensional Poverty Index has served as a valuable analytical tool to identify the most vulnerable people – the poorest among the poor and revealing poverty patterns within countries and over time, thereby enabling policy makers to target resources and design policies more effectively.

This new Indian national version of the index complements the 10 indicators of the global MPI with metrics on maternal health and bank account under the dimensions of health and standard of living, respectively. The resulting work offers powerful insights that can enhance India's capability to reduce poverty as the country builds back stronger from the effects of the COVID-19 pandemic.

National and state averages can mask important distinctions. The Indian national MPI's granular data – which cover not only all the States and Union Territories, but also all the districts – can empower policymakers and local officials to manage complexity and scale, inform evidence-led policy, design programs, and track progress. It can also help fine-tune the policies and programmes of State governments who are at the forefront of public service delivery, social protection, and multidimensional poverty reduction in India's federal structure. It will also be a tool to inform public dialogue across a range of stakeholders, including civil society, the research community, and businesses.

We at UNDP reaffirm our commitment to our partners Government of India and NITI Aayog in the collective journey to eradicate poverty in all its forms and accelerate the achievement of the Sustainable Development Goals.

SHOKO NODA

Resident Representative
United Nations Development Programme
India

To end poverty in all its forms everywhere is at the core of the comprehensive, expansive, and interdependent framework of the 2030 Agenda for Sustainable Development adopted by the world in 2015. The Multidimensional Poverty Index (MPI) is a systematic, robust, and nuanced measure to estimate our progress towards achieving this goal. MPI as a measure was first developed by Oxford Poverty and Human Development Initiative (OPHI) and United Nations Development Programme (UNDP) for inclusion in UNDP's flagship Human Development Report in 2010, where it has been since published.

India's National MPI: Baseline Report & Dashboard is a milestone in its journey towards realising the SDGs, in particular –target 1.2 of the 2030 Agenda which specifically focuses on addressing poverty in all its dimensions. The national MPI is being launched at an important juncture where I am sure it will provide key insights into the development scenario at the national, State and district levels, especially for India's sustainable recovery from the COVID-19 pandemic. On this important national endeavour, it has been a genuine pleasure to collaborate with NITI Aayog –Government of India's premier thinktank, and with our partner OPHI.

India's national MPI will provide crucial insights into multiple cross-sectoral indicators for decision makers at the national, State and district levels. From the perspective of planning and policy design, it will complement existing metrics in tracking progress, informing high-impact interventions and simultaneously engendering evidence-based policy making.

I would like to express my heartfelt gratitude to Dr Rajiv Kumar, Vice Chairperson, NITI Aayog, for his visionary leadership and unwavering commitment in steering the process of instituting India's national MPI. I also extend my sincere appreciation to Shri Amitabh Kant, CEO, NITI Aayog, for his continuous engagement and encouragement in this endeavour. UNDP is committed to continue and strengthen this important partnership. Lastly, I commend Dr Sabina Alkire, Director, OPHI, and her team for the technical support in this exercise.

MESSAGE

DR. SABINA ALKIRE

Director

Oxford Poverty and Human Development Initiative
Department of International Development,
University of Oxford

It has been an honour to collaborate on India's National MPI: Baseline Report & Dashboard under the leadership of NITI Aayog, Government of India. This baseline report is a contribution towards measuring and monitoring progress on achieving target 1.2 of the Sustainable Development Goals on multidimensional poverty. It not only presents the MPI results – plus headcount ratio and intensity – at the national level, but also at the levels of States and all the districts of the country. The high-resolution disaggregation by indicators makes it a powerful policy tool to benchmark progress and inform policy making.

Similar to the interlinked nature of the goals and targets of the 2030 Agenda, as a measure, India's national MPI reflects the interlinkages across the indicators at the level of households. This is salient to designing and implementing coordinated multisectoral policies and focused interventions. As a policy tool, it can be utilised by decision makers to focus on reducing overall multidimensional poverty by targeting to reduce deprivations in each of its dimensions and indicators across the country at the sub-national and district levels. This disaggregation is crucial, especially in a country as diverse as India, for not only reflecting information on inter-State variations in outcomes, but also intra-State variations. The National MPI: Baseline Report & Dashboard is based on the rich dataset of the National Family Health Survey (NFHS) 2015-16. The follow-up to this baseline report, with the release of the NFHS 2019-20, will make it possible to estimate multidimensional poverty reduction trends as envisaged under SDG target 1.2.

I would like to express my sincere gratitude to Dr Rajiv Kumar, Vice Chairperson, NITI Aayog for his leadership, guidance and constant encouragement extended to this important project. Our technical assistance in this regard is a product of our strengthened partnership with UNDP India.

I would also like to congratulate Shri Amitabh Kant, CEO, NITI Aayog and his energetic, dedicated, and professional SDG team led by Ms Sanyukta Samaddar, Adviser, NITI Aayog, for producing this technically rigorous measure.

FOREWORD

SANYUKTA SAMADDAR

● ● ●
Adviser (SDG)

National Institution for Transforming India
Government of India

Our relentless efforts at NITI Aayog in adopting, implementing, and monitoring the Sustainable Development Goals at the national and subnational levels have been anchored on the core principle of “Leaving No One Behind”. Instituting a robust SDG monitoring framework, promoting healthy competition among the States, strengthening the statistical systems, and building partnerships with a range of stakeholders have primarily aimed at reaching the farthest behind first. Given India’s development context, the most effective way to ensure development of the most disadvantaged sections is through faster poverty reduction. To implement this strategy, the first step is to estimate and monitor poverty levels, using a framework which defines poverty in all its forms, which is relevant to the present and aligns with the SDGs and our national context. This is precisely what our efforts at NITI Aayog regarding Multidimensional Poverty Index (MPI) aim to achieve.

The national MPI, an aggregate measure which defines poverty, in simple terms, as the deprivation in crucial and basic parameters of health, education, and living standards, is a significant departure from the way poverty has been understood and conceptualised historically. This shift in focus from income or consumption expenditure as the basis of poverty estimation is founded on the policy narrative at the national level that human and capability development along with access to basic infrastructure is at the centre of India’s development policy. The national MPI is an outcome of NITI Aayog’s focussed strategy to execute this policy directive and the mandate given by the Cabinet Secretariat to improve India’s position in global rankings of important and globally accepted indices.

This baseline report on the national MPI estimates at the national, State/ UT, and district levels based on NFHS-4 (2015-16) is a pivotal first step in bringing multidimensional poverty as a tool to the policy table. The national MPI will complement monetary poverty statistics, throw light on “how many are poor” and “how poor are the poor”, track poverty over time, offer disaggregated estimates by States, districts, and population groups, and support priority-based resource allocation and targeted reforms, all at a granular level. We expect that the Report will play an instrumental role in sensitizing governments, researchers, civil society, the public, and other stakeholders on the need for and importance of MPI as a powerful policy instrument.

In this nationally important endeavour, we owe our deepest gratitude to the Central Ministries and the State Governments, which have strongly supported the national MPI initiative. The insightful discussions we have had during the MPI Coordination Committee meetings, and the detailed deliberations held with the States as part of our SDG-MPI workshops in more than 20 States in the past four months, have contributed immensely to improving the framework. We hope that the State-specific reform action plan will aid faster reduction of multidimensional poverty and will result in better outcomes as measured by subsequent NFH Surveys.

To fully realise the potential of the MPI as a policy tool for focused interventions towards addressing multidimensional poverty, utilising it at the level of States and districts is of paramount importance. In this regard we thank all the State Governments and especially the ones where we organised over 20 workshops in the State capitals with Chief Secretaries and senior Government officials from the departments and districts. These workshops facilitated building interest and engendering understanding and acceptability of this important tool for governance. The positive, enthusiastic and constructive feedback from our State governments has played a very important role in the process of developing the national MPI.

We are unequivocally thankful to Dr Sabina Alkire, Director, Oxford Poverty and Human Development Initiative, and her team for offering technical advice from time to time. As the designer of the global MPI, Sabina’s deep knowledge on the subject based on her experience of working with countries across the globe, has contributed significantly to the robustness of the national MPI.

We would like to place on record our gratitude to Ms Shoko Noda, Resident Representative, UNDP India, for her support to the project, as a key partner. We are certain that the MPI initiative will offer crucial inputs to UNDP’s SDG efforts across the country. We are also grateful to the United Nations Resident Coordinator and his office for their support to the project.

Our deepest thanks goes to Prof KS James, Director and Senior Professor, International Institute for Population Sciences (IIPS), and his team, for their unswerving support to the project. IIPS has been kind enough to share its expertise in Demographic and Health Surveys which has supported the project technically to a great extent.

Finally, sincere appreciation to my team in the SDG Vertical in NITI Aayog: Alen John, Farha Anis, Soumya Guha, Sourav Das, Sundar Mishra and Vidya Warriar. Special acknowledgments are due to the core team, comprising Soumya Guha, SDG Officer, and Sourav Das, Data Analytics Officer, who have remarkably shouldered the responsibility of this inordinately vast range of computations, estimations and visualisations at all levels, and the development of the reform action plan and the MPI Dashboard.

We are grateful to Shri Amitabh Kant, CEO, NITI Aayog, for his consistent support to the idea of multidimensional poverty, and the project and its initiatives. The project would not have been a success without the relentless support of our Hon’ble Vice Chairman, Dr Rajiv Kumar who has thrown his weight behind all efforts, with passion, to pursue the execution of the national MPI project.

We sincerely hope that the national MPI project and its outcomes will act as a strong force which will further accelerate SDG achievements for our country.

**CONTEXT
&
INTRODUCTION**

CHAPTER 1

INTRODUCTION INDIA'S NATIONAL MPI

The Resolution of the United Nations General Assembly on 25 September 2015 established the 17 Sustainable Development Goals (SDG). SDG 1 in its entirety (“End poverty in all its forms everywhere”) is multidimensional in nature and definition. While target 1.1 seeks to eradicate extreme poverty –measured as people living on less than \$1.25 a day (subsequently increased to \$1.90/day), target 1.2 aims at reducing multidimensional poverty, as defined by national definitions, by half.

The Multidimensional Poverty Index (MPI) has been used by the United Nations Development Programme in its flagship Human Development Report since 2010 and is the most widely employed non-monetary poverty index in the world (Godinot & Walker, 2020). It captures overlapping deprivations in health, education and living standards (UNDP, 2010). It complements income poverty measurements because it measures and compares deprivations directly. In this context, a national Multidimensional Poverty Index for India will enable estimation of poverty not only at the level of the States but also for all the 700 plus districts (600 plus in 2015-16, 700 plus in 2019-20) across twelve indicators, capture simultaneous deprivations and indicator-wise contribution to poverty, and most importantly, will facilitate formulation of sectoral policies and targeted interventions which contribute towards ensuring that “no one is left behind”. The district-wise estimation of the national MPI will also ensure reaching out to the furthest behind first through focused efforts on specific indicators and dimensions.

This chapter provides a brief overview of the national and international context of measuring poverty across multiple dimensions, the conceptual framework behind multidimensional measures and how they contribute towards ending poverty in all its forms. The latter half of this chapter discusses the salience and features of the national MPI and the purpose of such a measure

1.1 India - Multidimensional Poverty Index: National context and Global Goals

The history of poverty estimation in India dates back to as early as 1901 when Dadabhai Naoroji estimated poverty in the country based on the cost of a subsistence diet. In 1938, the National Planning Committee suggested a poverty line estimation based on living standards followed by the authors of the Bombay Plan in 1944. Addressing and ending poverty has been part of the national agenda since independence. Various committees, working groups and scholars including the working group of 1962, Dandekar and Rath in 1971 and the Y.K. Alagh taskforce in 1979 were engaged in the estimating the headline statistic of poverty to inform public policy. Similarly, the Expert Groups under Lakdawala (1993) and Tendulkar (2009) and the Rangarajan Committee (2014) undertook the exercise of estimating monetary poverty. Globally, the focus on reducing monetary poverty was mirrored in the Millennium Development Goals target of halving the proportion of people living on less than \$ 1.25 a day between 1990 and 2015.

The adoption of Transforming our world: the 2030 Agenda for Sustainable Development by 193 countries of the United National General Assembly, including India, brought institutionalised focus in measuring, and addressing poverty in “all its forms” enshrined in its preamble and explicated under Goal 1. The impact of this was also reflected in the work of the World Bank, the custodian of the International Poverty Line (IPL) statistic, which convened a high-level Commission led by Sir Anthony Atkinson and supported by an advisory board of global poverty measurement experts.

One of the specific tasks of this commission was to go “beyond Goal 1.1” and engage with “complementary indicators and multidimensionality” (World Bank, 2017). The Commission recommended the inclusion of a multidimensional poverty measure based on the counting approach, seen in the Alkire-Foster method of the MPI. The Global Coalition of Partners to End Child Poverty in its submission to this Commission emphasised on the importance of an aggregate multidimensional poverty measure and its potential to powerfully summarize and communicate global and national figures to a wider audience, therefore mobilising public support to end poverty in all its dimensions.

In India, the Cabinet Secretariat’s mandate on the MPI is aimed at utilising the monitoring mechanism of the Index to gauge and benchmark poverty reduction to improve the country’s performance and therefore, reach out to the furthest behind by identifying reform areas and formulating reform actions on each of its components. The development of the India MPI is intended to drive competition among the States and Union Territories and provide insights on multidimensional poverty at the subnational and district levels.

1.2 Conceptual framework of poverty and its multidimensionality

Early 20th century examples of attempts at capturing poverty and its multidimensionality include studies by Booth (1903) and Rowntree (1901) in the United Kingdom. For a measure of wellbeing, application of multidimensional approaches dates back to the Level of Living Survey conducted in Sweden in 1968 (World Bank, 2017). Townsend’s landmark study in 1979 serves as an early example of a multidimensional approach towards relative deprivation across 60 indicators which covered dimensions like diet, clothing, fuel and light, housing, conditions and security of work, recreation, health, and education. Similarly, the European Union’s portfolio of social indicators to monitor social protection and inclusion is inherently multidimensional in nature. The need for complementary non-monetary statistics also stems from the rec-

ognition that income is one of the many dimensions and not the only attribute of wellbeing (Chakravarty, 2009).

The theoretical underpinnings of a non-monetary approach towards poverty and instead, as a multidimensional phenomenon is drawn from the capability approach (Sen 1979, 1987, 1999). The capability approach suggests that functionings and capabilities are two integral parts of a person’s quality of life and well being where functionings are the “beings and doings” that they value and have reason to value –such as being healthy and nourished; and capabilities reflect the freedom that they have in achieving valuable functionings. Therefore, to arrive at the conclusion that a household or individual is deprived in basic capabilities, it is pertinent to examine and consider multiple dimensions of well being (Dotter & Klasen, 2020).

Multidimensional measures complement monetary measures by capturing information they lack –such as broader qualitative aspects of life such as child mortality, housing conditions, and other basic services such as water and sanitation (Greve, 2020). This is of significance to policy formulation and targeted interventions in the context of intra-country or intra-region heterogeneity in development.

Simple headcount related measures do not provide information on the depth of poverty, as the Atkinson Commission observes, and therefore, potentially, while the extent of poverty captured by the headcount ratio can reduce, the poorest may fall even further behind. To address this, the Multidimensional Poverty Index, based on the Alkire-Foster method, employs an adjusted headcount ratio (MPI score) which is arrived at by multiplying the headcount ratio with the average deprivation among the MPI poor (Alkire & Foster, Counting and Multidimensional Poverty Measurement, 2011). In 2010, this measure of multidimensional poverty replaced the Human Poverty Index (HPI) in UNDP’s Human Development Report. It draws from the capability approach by including multiple dimensions of poverty across the dimensions of health, education and living standards, and examines the “fundamental objective features” which affect the poor (Brando & Fragoso, 2020).

1.3 Ending poverty in all its forms: Multidimensional Poverty Index

The multidimensionality of poverty is an integral part of the Sustainable Development Goals. Target 1.2. refers to reducing “at least by half the proportion of men, women and children of all ages living in poverty in all its dimensions according to national definitions”. The interlinked nature of the SDGs is reflected in mul-

tidimensional poverty measures as well, since they examine deprivations in areas such as nutrition (Goal 2), health (SDG 3), education (SDG 4) and living standards related indicators such as water and sanitation (SDG 6), and electricity and clean cooking fuel (SDG 7), among others.

Development of multidimensional poverty measures was motivated to not only capture multiple but also overlapping deprivations faced by the poor, which was not sufficiently reflected in monetary poverty measures (Alkire, 2020). Measures such as the MPI, based on the Alkire-Foster methodology, consider simultaneous deprivations and disadvantages articulated through indicators in the broad dimensions of adequate health and nutrition, education, and standard of living. MPI can be utilised as a complementary policy tool to monetary poverty, to build and illuminate a more comprehensive depiction of poverty. The information and insights from this tool can drive cross-sectoral policies which address the interconnected and simultaneous disadvantages and deprivations faced by the poor. Two distinctive normative conditions are fulfilled by the MPI –the recognition that non-monetary deprivations are integral to what can be termed as poverty, and that deprivations often simultaneously overlap. As discussed above, MPI not only concerns itself with the headcount ratio of proportion of people who are multidimensionally poor but also includes important information on average deprivations or “depth of poverty”. The Index also provides information of policy relevance on each of the indicators by way of deconstructing each of the indicators for sectoral focus and elucidating cross-sectoral overlaps exhibited through multiple deprivations. Therefore, the MPI as a measure of multiple dimensions of poverty complements monetary poverty statistics, enables close monitoring of individual indicators and dimensions which overlap with several SDGs, allows for disaggregation at the levels of States and districts, and urban and rural to better inform policy focus, and engenders integrated cross-sectoral policy actions by capturing multiple deprivations in its methodology. Apart from its theoretical and statistical merits, the MPI produces clear and easy insights to communicate policy relevant information for a wider audience.

In 2010, the Multidimensional Poverty Index (MPI) developed by Sabina Alkire and James Foster was adopted by the United Nations Development Programme (UNDP) in their Human Development Report as a replacement for its Human Poverty Index. The MPI serves as a complementary measure to the more traditional measures that are based on income or consumption. The rationale for multidimensional measurement of poverty is that wellbeing can be adversely impacted in many forms that may only be

indirectly related to an individual's income or level of consumption. Deprivations can include an overlap related to poor health, undernourishment, and inadequate access to clean cooking fuel, electricity, water, sanitation, and housing. Importantly, the MPI also reflects some of our national priorities articulated through focused interventions on housing, clean water, sanitation, cooking fuel, electricity along with our universal education goals, improved nutrition and good health for all.

1.4 National MPI: Salience and features

A national MPI is a headline statistic of multidimensional poverty that is used (OPHI, 2019):

- To compare poverty across subnational regions,
- To track poverty over time,
- To highlight “how” poor are the people in poverty, using direct information from the set of MPI indicators.
- National MPIs are always reported along with several intuitive statistics that show the level and composition of poverty by indicator. These are:
 - Incidence, ‘H’ which shows the percentage of people who are multidimensionally poor.
 - Intensity, ‘A’ which shows the percentage of weighted deprivations the average multidimensionally poor person suffers from.
- The national MPI is constructed directly from each person's profile of deprivations across each indicator, built from a single household survey that captures the data on all the indicators. So, the national MPI is always reported together with its composition by indicator. This is done in one of two ways: (1) analysing the percentage of people who are multidimensionally poor and deprived in each indicator one by one, and (2) analysing the weighted contributions of each indicator to the national MPI.

1.5 Purpose of National MPI as a measure

A national MPI statistic for a country is tailored to the national priorities and therefore, countries choose their own set of dimensions, indicators, weights, and cut-offs, according to their plans and contexts (OPHI, 2019). National MPIs are disaggregated by subnational regions, urban or rural areas, age, and other factors. They are also always reported with the indicator-wise deconstruction and breakdown. These details can guide and monitor national policies such as budget allocation, targeting specific interventions, and policy coordination across sectors. The purpose of constructing such a measure is discussed below:

- **Enhanced high-level view of poverty at the national level:** The international community, including government officials, international agencies,

academia, and society, understand poverty today as a complex, multidimensional phenomenon. The national MPI provides a high-level view of the level of multidimensional poverty and its change with time. This presents an overall picture of poverty in the country, while also enabling closer and more in-depth analyses of areas of interest such as regions –State or districts, and specific sectors –under the dimensions of health and nutrition, education and living standards.

- **Complements monetary poverty measures:** The national MPI complements existing monetary poverty statistics. The dimensions of the Index have proven to help identify and achieve targeted policy interventions. The ability to provide a better depiction of poverty and inform more precise policy actions has been an incentive in every country that has developed a national MPI so far. Evidence has shown that people who are experiencing multiple deprivations in crucial areas of their lives, such as education, health, safety, or employment, may not be income poor (Bourguignon, et al., 2008), and policies to reduce income poverty may not affect other deprivations. Furthermore, public action in areas like education, infrastructure, and housing, which might only impact income in the next generation, are not well captured by traditional monetary metrics. In contrast, a national MPI that includes such indicators can show rapid improvements in these areas, making visible the impact of social policies and interventions more directly.
- **Information to shape policy:** A national MPI can guide coordinated actions by several ministries and departments, provide clear goals and targets for each indicator, and act as a monitoring and accountability tool within the government. One reason for this is that it allows robust disaggregation by groups (such as between urban and rural areas, subnational regions, gender, age groups,). One can also unpack the numbers to analyse the composition of poverty by dimensions and indicators –nationally, and at the level of States and districts, which allows for more efficient policy design, policy coordination and focus, and assignment of resources.
- **The MPI is based on each person's or household's profile of the overlapping or “joint” deprivations they experience:** This provides new information that is not available in many other measures of poverty estimation. For example, 20 percent of the population may not have access to adequate sanitation and 20 percent may have insufficient education, but these two indicators separately do not provide information on the degree of intersection

of the population without adequate sanitation and those without an adequate education. Elucidating such overlaps is a specific feature of the MPI. This additional information is extremely relevant for identifying the poorest of the poor, who experience serious and multiple deprivations at the same time. It is also useful for guiding multisectoral and integrated policies, because it highlights the complexity of simultaneous deprivations.

- **Provides incentives for leaving no one behind and reaching the furthest behind first:** By reflecting the intensity of poverty (detailing the multiple deprivations that a family has at the same time), the national MPI has an advantage over headcount poverty measures since efforts to reduce the proportion of simultaneous hardships faced by the poor will reduce the MPI even if they have not yet moved out of poverty. For example, if a poor person goes from being deprived in 90 percent of the indicators to being deprived in 50 percent of them, then the MPI goes down, even if they are still identified as multidimensionally poor. This further bolsters the incentive for focussing on the poorest of the poor, because if any deprivation of any multidimensionally poor person is removed, the MPI falls.
- **Adaptable to national context and transparent:** The design of the national MPI is flexible, as the dimensions, indicators and weights can be adapted to the national context. These are attributes that can be defined by policymakers to accurately characterize poverty in diverse contexts. The national MPI is also transparent and easy to implement. This provides legitimacy for official estimates. In addition, it is intuitive and easy to communicate to the media, private sector and civil society as seen in countries which have implemented such a measure.
- **Robustness and rigor:** It is crucial that an official poverty measure be robust. It means that the policy conclusions are not overly sensitive to small changes in its own components, like indicators, cut-offs or weights. This is because in a pluralist societies people often agree on a broad range of priorities but disagree on details. A measure that is robust to a number of specifications has more legitimacy among a wider group of citizens and stakeholders. Furthermore, the national MPI can be rigorously applied, using standard errors and tests of statistical inference. This means that policymakers can ensure that their statements –such as “poverty has reduced” refer to statistically significant changes.

CHAPTER 2

DEVELOPING INDIA'S MPI THE PROCESS

2.1 The Global Indices for Reforms & Growth (GIRG) mandate

In early 2020, the Cabinet Secretariat, Government of India, identified 29 global indices to monitor, analyse and evaluate with the aim of improving India's position in global rankings. Under this mandate, also known as the Global Indices for Reforms and Growth (GIRG) mandate, NITI Aayog was identified as the nodal agency for the Multidimensional Poverty Index (MPI).

The GIRG exercise is aimed at leveraging the monitoring mechanism of important social, economic and other internationally recognised indices to drive reforms and growth. The primary goal of this exercise is to gauge India's performance - not only on the overall country's result in the indices but on the parameters and sub-parameters as well; and subsequently draft an action plan to improve in those areas and sub-areas.

It was widely recognised that this exercise would require a whole-of-government approach in letter and spirit. As one of the first steps in this direction, NITI Aayog, as the nodal Ministry for the MPI, identified all relevant Union Ministries and departments which mapped not only to the broad dimensions of the index but also to the individual components, parameters and sub-parameters. For example -improvement in dimensions such as living standards required co-ordination among Ministries concerned with cooking gas, electricity, rural and urban development, ministries which work on housing, sanitation and drinking

water, and so on. This exercise also enabled the identification of existing government actions articulated through schemes and policies which were definitionally impacting the parameters and sub-parameters of the index: for example, various nutrition, and child and maternal health related schemes which impact the MPI dimension of health. It underscored the importance of inter-ministerial coordination and partnership for effective and focused action.

The emphasis of the GIRG initiative is not only to improve country's performance and ranking but to leverage them as tools for systemic reforms in the policies and processes aimed at improving and enhancing the ease of living. In this context, NITI Aayog has been co-ordinating with the concerned Ministries and departments mapped to the indicators and sub-indicators of the index to develop a roadmap and action plan. Parameter and sub-parameter linked reform areas and actions are being developed by the inter-ministerial committee on the index. The exercise includes the identification of reform actions, duration, sub-national applicability, priority and target setting for implementation by Ministries and departments.

As the nodal agency, NITI Aayog is also responsible for constructing an indigenised index for monitoring the performance of States and Union Territories and ranking them. The national MPI for India is a milestone contribution towards this effort. It aims to become the primary tool for monitoring progress on SDG 1 'ending poverty in all its forms everywhere' in the country and simultaneously foster competition among

the States and Union Territories to expeditiously take action towards this goal. In this endeavour, engagement with publishing agencies and relevant technical partners was impressed upon from the outset. Building partnerships and engaging with- i) the publishing agencies— United Nations Development Programme (UNDP) and Oxford Poverty and Human Development Initiative (OPHI) and ii) other technical partners such as the survey implementors of the National Family Health Survey— International Institute for Population Sciences (IIPS) of Ministry of Health and Family Welfare, has been critical in developing the national MPI for States and districts and ensuring its technical rigour and robustness.

To institutionalise this inter-ministerial effort for developing the national MPI and formulating reform areas and actions, the Multidimensional Poverty Index Coordination Committee (MPICC) was constituted by NITI Aayog, which included twelve Ministries and departments.

2.2 MPI Coordination Committee (MPICC)

The inter-ministerial coordination committee constituted under NITI Aayog included Ministries and departments pertaining to areas such as health, education, nutrition, rural development, drinking water, sanitation, electricity, and urban development, among others. It also included experts from Ministry of Statistics and Programme Implementation and the publishing agencies - OPHI and UNDP.

The composition of the MPICC drew from the multidimensional nature of the indicators and sub-indicators within the index. This brought forth a cross-sectoral

collection of perspectives on policies and interventions to improve achievements at the level of households. It also highlighted various approaches required for improving outcomes of intrinsic significance such as nutrition and education; and material infrastructure and household services such as electricity, drinking water, cooking fuel and others.

As critical stakeholders in the process, the MPICC engaged in extensive discussions on the index, its theoretical underpinnings, technical computations and indicators. The inaugural MPICC round tables on different facets of the index enabled a technical exposition of the computation of the index, the Alkire-Foster method, dimensions, indicators and cut-offs. Consequently, deliberations on two facets of the GIRG exercise -i) developing an India index or national MPI and ii) identification of reform areas and actions, took place simultaneously.

NITI Aayog in collaboration with the publishing agencies (OPHI and UNDP) led the discussion on developing the national iteration of the index, with the MPICC. The guiding principle of this exercise was the objective of developing a national measure which can contribute towards measuring the progress under SDG 1 -of halving poverty in its multidimensional form, and subsequently supporting evidence-based policymaking to formulate government action to address it. Members from each Ministry of the MPICC explicated their experience in their domain in relation with public service delivery and the macro challenges in each sector in a demographically and geographically diverse country such as India. Their rich experience in identifying past, present and future challenges in their respective sectors informed the discussion on indica-

tor selection and formulating the reform areas. This was followed by technical feasibility assessment of the indicators in the NFHS and selection of respective weights. Cognizance was taken to enable the national MPI to simultaneously track the performance of the country, and all States and districts on the global indicators of the Index. Drawing from the GIRG mandate, the consensus was twofold: i) to adapt the MPI to the national and local contexts while tracking the global MPI indicators and ii) to estimate it not only at the level of the States, but districts as well.

2.2.1 Engagement with States: Building consensus on MPI at the subnational level

State and Union Governments are pivotal stakeholders which make up the institutional bulwark of the country. With 36 States and Union Territories and over 700 districts –subnational entities represent the myriad socio-political, geographical and economic diversity in the country. For a public policy tool such as the national MPI to fully realise its potential, utilisation of its results and findings by State and UT governments is crucial. Simultaneously, the success of identification and implementation of reform areas and actions to improve the lives of households and individuals, would significantly be influenced by the level of adoption at the level of States. Therefore, building consensus on the need to create a national MPI and the model thereof, developing capacities, understanding and appetite for this novel policy tool, with our primary stakeholders, i.e., the State governments and policy makers and implementers at the sub-national level, was felt to be imperative at the stage of MPI project design. Close collaboration and extensive engagement with subnational governments –through State MPI workshops with top policy makers and all line departments in the States, was recognised as a pivotal driver of outreach on the Index.

NITI Aayog, at the time of writing, had organised MPI workshops in the capitals of over 20 States. These workshops were chaired by the Chief Secretaries and other senior officials of the State Governments, district level officials, and in some cases by the Chief Ministers. The meetings covered the basics of MPI, mandate from Cabinet Secretariat, India's position in global rankings, index estimations, status of the State on MPI and district-wise performance, MPI parameter dashboard, national MPI, and reform action plan. The technical sessions on computation were conducted in the presence of the State Statistical Officers and district officials to generate feedback and insights from their experience on the ground. The feature of the index –to estimate multidimensional poverty for the districts of a State, generated significant interest among the stakeholders for the measure itself. Insights on

district performance including that of headcount ratio, intensity of poverty, factors causing poverty, censored and uncensored deprivations and contribution to MPI, were of keen interest to the departments and district administrations.

Deliberations in these 20 State-level MPI workshops largely focused on the State-specific developmental specificities, experience in domains of public service delivery, challenges in the related sectors contextual to the developmental reality of the State, and intra-State diversities. Issues related to convergence of inter-departmental action, synergies across line departments to achieve the broad outcomes aligned with the parameters of the Index, challenges to the efficacy of implementation of the aligned Centrally Sponsored Schemes and State schemes, analysis of sub-optimal efficiencies in public service delivery, assessment of the adequacy of financial, technical, and human resources, level of capacities of the State statistical systems to generate high frequency data for periodic monitoring, inter alia, were some of the most recurring discussion points that emerged during the MPI workshops in the States. The common outcome of these numerous State meetings was consensus that it is important to monitor and reduce multidimensional poverty, MPI is a technically robust and contextually relevant instrument, and progress monitoring at district level is crucial.

The draft State Reform Action Plan with an illustrative set of reform areas and actions for each indicator to achieve progress as measured by the Index was also presented to the Chief Secretaries and Heads of Departments in these workshops. The reform action plan has to be further customised by the State Governments to align it with its own context and reality. Therefore, the workshops paved the way for i) the introduction and deliberation on this important measure of multidimensional poverty which goes as granular as the district, ii) presentation on the causal factors to the MPI estimates and the areas of improvements and iii) discussions on formulation of reform areas and actions for improving the lives of households in the sectors under the purview of the MPI.

The process of developing the national MPI, since its beginning, has been a collaborative one. As the tool has to have both policy utility and technical robustness, no stone has been left unturned in ensuring that expert opinions, ground realities, and practical approaches have been accommodated. Both central ministries and State governments contributed immensely to this process. The road ahead too will be collaborative, with active involvement of all relevant stakeholders.

WORKSHOPS AND CONSULTATIONS HELD WITH 21 STATES AND UNION TERRITORIES

METHODOLOGY & WAY FORWARD

CHAPTER 3

METHODOLOGY COMPUTING INDIA'S MPI

3.1 The Alkire-Foster Methodology

At the core of the MPI is the Alkire-Foster (AF) methodology. The AF methodology is a general framework for measuring multidimensional poverty that identifies people as poor or not poor based on a dual-cutoff counting method. The first order cut-off within each component indicator is applied to determine which person is “deprived” in that indicator. The information across all indicators is then aggregated to arrive at a deprivation score for each individual. The second order cut-off is then applied to identify the individuals who are multidimensionally poor. The AF methodology is an extension of the widely accepted Foster-Greer-Thorbecke (FGT) class of poverty measures and has a range of technical and practical advantages that make it favorable for use in non-monetary poverty estimation.

Poised within a family of axiomatic measures, the AF methodology achieves multiple technical milestones associated with poverty measures including dimensional monotonicity, subgroup decomposability, scale and replication invariance, poverty and deprivation focus and symmetry. This ability of the AF methodology to provide an idea of not only the degree of poverty but also its composition and distribution is what makes it a powerful tool for decision-making.

The AF methodology's intuitive counting approach for poverty identification, explicit consideration of joint distributions, consistent partial indices and most

importantly, its ability to utilize ordinal or binary data, make it adaptable to existing data systems without the need to introduce any specialized modules within surveys that relate only to the estimation of multidimensional poverty.

The dual-cutoff approach of the AF methodology also mitigates a number of issues that arise from the union and intersection approaches in the measurement of multidimensional poverty with the former tending towards overestimation and the latter tending towards underestimation. The flexibility it provides (within bounds of logic and reason) in terms of selection of indicators, determination of first and second order cutoffs and indicator weights adds a layer of customization essential for the construction of a multidimensional poverty measure suited to the national context.

3.2 Steps in computing the MPI

The process of computing the MPI can be divided into 2 broad categories: i) Identification, and ii) Aggregation.

3.2.1 Identification

- Determine the set of indicators to be used in the MPI and group thematically similar indicators into dimensions. For example, years of schooling and school attendance are indicators under the dimension of education.

- Set the deprivation cut-offs for each indicator, i.e., the level of achievement considered normatively sufficient in order for an individual to be considered not deprived in an indicator. E.g., the individual has completed at least six years of schooling.
- Apply the cutoff and determine whether the individual is deprived in each indicator.
- Select weights to be applied to each indicator such that the sum of the weights for all indicators adds up to 1. Optionally, the weights of the indicators could be such that the weight attributable to each dimension (i.e. the sum of the weights of the indicators in that dimension) is the same.
- Calculate the weighted sum of deprivations for each individual. This is known as their deprivation score.
- Apply the second order cutoff, i.e., the proportion of weighted deprivations that an individual needs to experience to be identified as multidimensionally poor. India's national MPI follows the second order cutoff of 33.33 percent used in the global MPI measure.

3.2.2 Aggregation

- Determine the proportion of individuals identified as multidimensionally poor in the population. This is known as the headcount ratio (H) of the MPI or the incidence of poverty. The headcount ratio broadly explains ‘how many are poor’.
- Determine the average share of weighted indicators in which multidimensionally poor individuals are deprived i.e., add the deprivation scores of the poor and divide it by the total number of poor individuals. This is known as the intensity of poverty (A) in the MPI or the breadth of poverty, which broadly explains ‘how poor are the poor’.
- Compute the MPI score (M_0) as the product of the partial indices of Headcount Ratio and Intensity.

3.3 Indicators in India's National MPI

The national MPI model retains the ten indicators of the global MPI model, essentially to be closely aligned to the global methodology and rankings. India's MPI has three equally weighted dimensions – health, education, and standard of living – which are represented by twelve indicators (Figure 1).

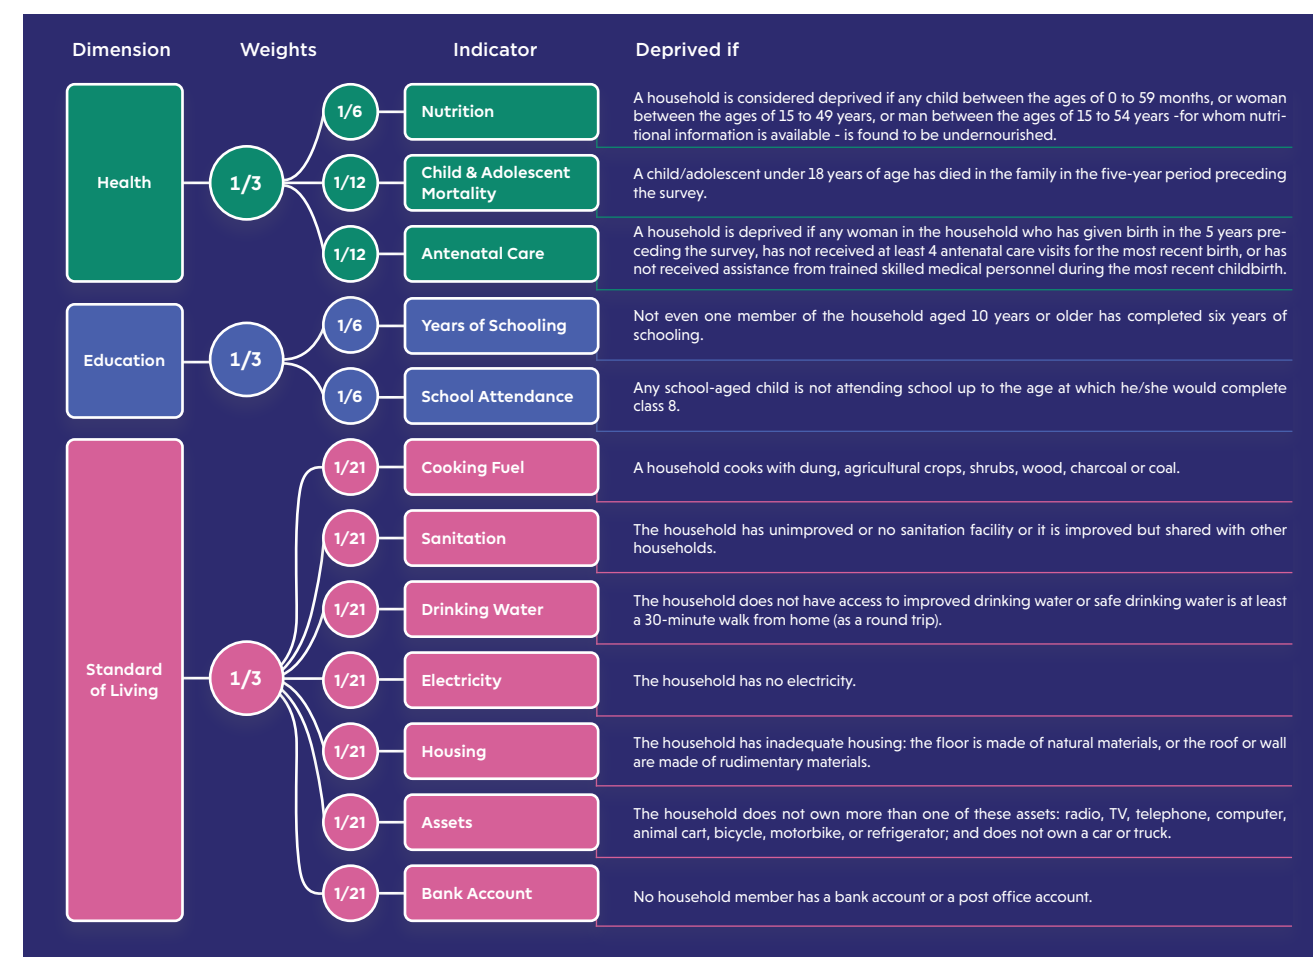

FIGURE 1: INDICATORS IN INDIA'S NATIONAL MPI

3.3.1 Dimension: Health

The 'health' dimension comprises parameters representing nutrition, child mortality and maternal health. The indicators for Nutrition and Child Mortality echo the definitions and cutoffs followed by their counterparts in the Global MPI. The indicator for Maternal Health is unique to India's national MPI. A point of note is that in the national MPI, the Child Mortality indicator has been renamed as Child-Adolescent Mortality. According to the parlance of the Indian statistical system, the use of the term "Child Mortality" is usually associated with mortality under 5 years of age. Given that the indicator in the MPI refers to deaths below 18 years of age, the indicator has been renamed so as to mitigate confusion arising from the nomenclature.

Digressing from the precedent set by the Global MPI measure, the indicators in the dimension for Health are not equally weighted. Nutrition – with a weight of 1/6, carries half the dimension weight of 1/3. The remaining dimension weight is split between Child-Adolescent Mortality and Maternal Health, with each indicator having a weight of 1/12. The sharing of weights between the Child-Mortality and Maternal Health Mortality prevents the overall MPI measure from favoring households with no children or households with no births in the last 5 years, while allowing for the monitoring of deprivations in the domains of childbirth, and access to antenatal and maternal care. The shared weights also allow for the indicator on Nutrition to retain its weight in the Global MPI, thus enabling uniformity in reporting across both.

3.3.1.i Nutrition

A household is considered deprived if any child between the ages of 0 to 59 months, or woman between the ages of 15 to 49 years, or man between the ages of 15 to 54 years -for whom nutritional information is available- is found to be undernourished.

A woman (15 to 49 years) or a man (15 to 54 years) is considered undernourished if their Body Mass Index (BMI) is below 18.5 kg/m². Children under 5 years of age are considered malnourished if their z-score of height-for-age (stunting) or weight-for-age (underweight) is below minus two standard deviations from the median of the reference population.

It is to be noted that even if a single member of the household is identified as undernourished, the entire household is treated as deprived in nutrition. This is owing to two primary reasons: i) the unit of analysis is

the household, and ii) the indicator for nutrition operates within the implicit principle of shared positive or negative externality, wherein the debilitating effects of undernourishment on one household member will have a direct or indirect effect on other members of the same household.

Contributing to nearly one-third of the multidimensional poverty in India, nutrition is arguably one of the most important indicators in India's national MPI. Malnutrition has significant consequences to early childhood development as well as to the health and overall wellbeing of adults. The indicator for nutrition carries a weight of 1/6 and its definition is aligned with the Global MPI.

3.3.1.ii Child-Adolescent Mortality

A household is deprived if any child or adolescent under 18 years of age has died in the household in the five-year period preceding the survey.

The child-adolescent mortality indicator is based on birth history data provided by mothers aged 15-49 years. However, if the data from the mother is missing, and if the male in the household reported no child-adolescent mortality, then the household is reported to be not deprived. A household with no children would also be treated as not deprived.

For the five-year period preceding NFHS 2015-16, the neonatal mortality rate (i.e., the probability of death within the first month of life) was 30 deaths per 1000 live births. This means that one newborn in 33 live births died during the neonatal period. The under-five mortality rate during this time period stood at 50 deaths per 1000 live births, indicating that one in 20 children in India, died before their fifth birthday. A significant proportion of neonatal deaths are a result of preventable diseases and, lack of access to pediatric healthcare. Certain demographic risk factors can also be identified with under five deaths being significantly higher among vulnerable population groups (for instance, Scheduled Tribes, and Scheduled Castes) and among the lowest wealth quintiles (Ministry of Health and Family Welfare, 2017).

The rationale behind the indicator on Child-Adolescent Mortality and the age group it considers is that it is indicative of the set of deprivations experienced by the household which may have contributed to the unfortunate demise of a child in the household and the effect of that incident on the set of deprivations that the household may experience over time.

The death of a child or adolescent in a household is emblematic of a larger set of deprivations already experienced by the household. Factors such as, lack of access to healthcare, infectious diseases, malnutrition, iron-deficiency anemia, an unsafe environment are all contributors to child and adolescent mortality (WHO, 2017). The death of a child or adolescent therefore indicates the deprivations experienced by a household in one or more of these factors. Furthermore, it highlights the risks that other living children or adolescents in the household are being exposed to.

Child-Adolescent mortality also possesses multiple negative externalities which directly affect all individuals and in extension the deprivation status of the individuals in that household. These externalities can manifest in a number of different ways over time.

For example, the death of a school-going child aged 10 years or older may deprive the household of their only member who had attained more than six years of schooling, thereby depriving them of the positive externalities that are associated with having a household member with formal education. Another example, where a more direct effect can be observed is where a 17-year-old adolescent who was an earning member of a household in the lowest wealth quintile passes away resulting in their sibling having to drop out of school.

It is therefore that the death of a child or adolescent below the age of 18 years in a household is normatively considered a tragedy for the household and is included as a determinant for multidimensional poverty. The indicator for Child-Adolescent Mortality carries a weight of 1/12 and its definition remains aligned with the Global MPI.

3.3.1.iii Maternal Health

A household is deprived if any woman in the household who has given birth in the 5 years preceding the survey has not received at least 4 antenatal care visits for the most recent birth or has not received assistance from trained skilled medical personnel during the most recent childbirth.

Introduced as a new indicator to India's national MPI, the indicator for Maternal Health is a union of two distinct components – antenatal care and assisted delivery. The indicator captures if a woman in the household who has given birth in the 5 years preceding the survey has received at least 4 antenatal care visits and has received assistance from skilled medical person-

nel during the most recent childbirth. Not fulfilling any one of the two criteria would cause the household to be considered deprived. If the household has not had any births in the 5 years preceding the survey, it would be considered to be not deprived in this indicator. The indicator carries a weight of 1/12.

Antenatal care (ANC) and assisted delivery, even when taken in isolation, form a critical prerequisite to positive healthcare outcomes for mothers and newborns alike. With a significant percentage of maternal deaths occurring during the period of pregnancy, the four-visit antenatal care model outlined in the WHO clinical guidelines has been instrumental in the early identification of complications in pregnancy, monitoring of foetal growth and the management of complications through the referral of mothers to the appropriate facility for further treatment.

In India, as per NFHS-4, only 51 percent of women had received at least 4 ANC visits during their most recent pregnancy with the highest proportion of women being in Kerala (90 percent) and the lowest in Bihar (14 percent). There also exists a significant disparity of ANC among income groups with women in the highest wealth quintile being almost twice as likely to have received ANC from a skilled provider than women in the lowest wealth quintile.

Of all globally reported child deaths, 2.5 million occurred within the first month of life and 2 million were stillbirths (UNICEF, WHO, World Bank, United Nations, 2019). According to NFHS-4, in India, approximately 60 percent of deaths below 18 years are neo-natal and infant deaths occurring before the completion of the first month since birth and before the completion of one year since birth, respectively.

The causes of nearly 80 percent of new-born deaths can be identified and there are solutions to address them, preventing death or life-long disability (WHO, UNICEF, 2014). These causes are - complications due to prematurity, intrapartum deaths, and neonatal infections. Thus, ANC cannot be looked at in isolation as prevention of intrapartum deaths requires quality care provided during childbirth. In India, 81 percent of live births were assisted by a skilled provider. 93 percent of women who had received four or more ANC visits also received skilled assistance during delivery as compared to only 60 percent of women who had no ANC visits.

It is based on this premise that India's national MPI digresses from the precedence of Afghanistan, Gua-

temala, Panama, and Pakistan (which have indicators for either one of the two, ANC or assisted delivery in their respective national MPIs). India's MPI seeks to adopt a stricter union measure when determining the deprivation status of an individual in Maternal Health - ensuring that an expectant mother must receive both 4 or more antenatal care visits and be assisted by skilled personnel during childbirth.

India being a signatory to the 2030 Agenda, the maternal health indicator in the national MPI aims to enforce strict compliance to the SDG targets of reducing maternal mortality and end preventable deaths of new-borns in the country.

3.3.2 Dimension: Education

The 'Education' dimension is represented by parameters pertaining to school attendance and years of schooling, with each indicator - weighted at 1/6 - carrying half of the dimension weight (1/3) for Education. The definitions and cut-offs for the indicators remain unchanged and aligned with the Global MPI.

3.3.2.i Years of Schooling

A household is deprived if not even one member of the household aged 10 years or older has completed six years of schooling.

Years of schooling has a shared positive effect on the household, wherein even if one member has more than six years of schooling, the positive effect of that education, be in terms of increase in economic opportunities such as the ability to enter high paying employment or in terms of improvement in social standing, is shared among all members of the household.

A point to be noted is that because of the nature of the indicator, an individual living in a household where there is at least one member with six years of schooling is considered to be non-deprived, even though they themselves may not have attended school. The indicator carries a weight of 1/6.

3.3.2.ii School Attendance

A household is deprived if any school-aged child is not attending school up to the age at which he/she would complete class 8.

The indicator for school attendance is the logical precursor to the indicator for years of schooling. A child not attending school is indicative of both the present set of deprivations experienced by the household as well as the possible future deprivations that may un-

fold as a result of the child not attending school. A child not attending school is emblematic of a greater set of deprivations being experienced by the household that acts as an impediment to the education of the child. Similarly, because the child is not attending school, the household members will be deprived of the positive externalities that arise from having a formally educated member in the household.

An individual living in a household where there is at least one child not attending school, is treated as deprived in this indicator, even though they themselves may have completed schooling. The indicator has a weight of 1/6.

3.3.3 Dimension: Standard of Living

Lastly, the dimension for 'Standard of Living' comprises parameters representing access of the household to basic services such as electricity, clean cooking fuel, improved and safe drinking water, improved sanitation, pucca housing (proper flooring, roof and walls), bank account, and household assets. All indicators with the exception of the indicator for bank accounts - which is unique to India's national MPI - align with the global definitions and cutoffs. The dimension weight of 1/3 is split evenly across all the seven indicators therefore giving each a weight of 1/21.

3.3.3.i Cooking Fuel

A household is deprived if the primary source of cooking fuel is dung, agricultural crops, shrubs, wood, charcoal or coal.

Improved or safe sources of cooking fuel include electricity, LPG/natural gas, biogas. A point of importance here is that simply the presence of an improved/safe source of cooking fuel in the household is not enough to warrant a "not deprived" status. The household must also be utilizing the improved/safe source of cooking fuel as their primary source of cooking fuel - i.e. a household may have a LPG connection and stove, but if wood/coal is the primary (most used) fuel for cooking, then the household will be considered to be deprived in the indicator.

3.3.3.ii Sanitation

The household has unimproved or no sanitation facility or it is improved but shared with other households.

Improved sanitation includes any non-shared toilet of the following types: flush/pour flush toilets to piped sewer systems, septic tanks, and pit latrines; venti-

lated improved pit (VIP)/biogas latrines; pit latrines with slabs; and twin pit/composting toilets. It must be noted that exclusive access to an improved sanitation facility, which is not shared with members of another household, is required for a household to be considered not deprived in this indicator.

3.3.3.iii Drinking Water

A household is deprived if it does not have access to improved drinking water or safe drinking water is more than a 30-minute walk from home (as a round trip).

Safe or improved sources of drinking water include piped water supply, public taps, standpipes, tube wells, boreholes, protected dug wells and springs, rainwater, and community reverse osmosis (RO) plants. Even if a household has access to an improved water source, it will be considered deprived in this indicator if the source is more than 30-minute roundtrip walk from home.

3.3.3.iv Electricity

A household is deprived if it has no electricity.

Access to household electricity has a multiplier effect on any household and deprivation in this basic and essential service is ground for treating any household as deprived.

3.3.3.v Housing

A household is deprived if it has inadequate housing: the floor is made of natural materials, or the roof or walls are made of rudimentary materials.

Mud/clay/earth, sand and dung are considered rudimentary/natural materials.

3.3.3.vi Ownership of Assets

The household is deprived if it does not own more than one of these assets: radio, TV, telephone, computer, animal cart, bicycle, motorbike, or refrigerator; and does not own a car or truck.

In the case of the indicator for assets, the criteria for the car or truck ownership acts as an exclusion criteria. Therefore, even if a household does not have a radio, television, telephone, computer, animal cart, bicycle, motorbike, or refrigerator, but has either a car or a truck, then the household will be treated as non-deprived.

3.3.3.vii Bank Account

No household member has a bank account or a post office account.

The indicator for bank accounts is an additional indicator in India's national MPI. The ownership of a bank account or post office account is the key to financial inclusion of the hitherto unbanked households. The access of a household to a bank account is critical for availing the benefits of several flagship government programs aimed at reduction of poverty, increasing access to education, and creation of livelihoods - which often utilize direct benefit transfers. Bank accounts also play an important role in the delivery of public services, access to institutionalized credit and also act as long-term savings instruments - either through self-deposits or through institutionalized savings schemes.

Extensive evidence suggests that there exists a strong and positive correlation between access to financial services and improved capabilities and functionings. Empirical studies that have analyzed spatial data have cited significant correlation between areas with lower banking access and higher or relatively severe incidences of poverty (Iqbal, Roy, & Alam, 2020). Other studies which have probed demographic datasets have concluded that financial inclusion plays an important role in preventing a household's exposure to future poverty while also aiding in sustained escapes from poverty, especially female-headed households (Koomson, Villano, & Hadley, 2020).

These factors necessitate the inclusion of an indicator pertaining to financial inclusion in India's national MPI not only to identify the geographical regions and population sub-groups where immediate intervention is required but also to ensure that the efforts to fast-track financial inclusion in India are sustained.

The SDG target 8.1 focuses on strengthening the capacity of domestic financial institutions to encourage and expand access to banking and financial services for all. The inclusion of the indicator for bank accounts thus allows for the national MPI to have a larger coverage of and increased cross-linkages with the SDGs.

At the global front, the national MPIs of Rwanda and Sierra Leone also include indicator for bank accounts with the former having included it in a new dimension titled as "Social Services and Economic Inequality" and the latter having kept it in the dimension for "Standard of Living".

3.4 Computing the MPI

As stated previously, the process of computing the MPI is divided into two distinct stages – identification and aggregation. Identification involves obtaining the deprivation score for every individual followed by censoring of deprivation scores to identify the multidimensionally poor for a given cutoff. Aggregation involves the estimation of two partial indices, headcount ratio and intensity, the product of which provides us with the MPI. Each of the aforementioned concepts has been detailed in the following paragraphs.

3.4.1 Identifying the poor

Based on the AF methodology, identification of the poor is dependent on a set of within-indicator deprivation cutoffs as well as an across-indicators deprivation cutoff (hence the term dual-cutoff approach). The cutoffs within indicators (also known as the first-order cutoff) are used to determine the deprivation score while the across-indicator cutoff (also known as the second-order cutoff) is used to finally determine who is multidimensionally poor. Both concepts have been detailed in the following sections.

3.4.1.i Deprivation Score

Each individual (and in extension everyone in the same household), is first marked as deprived (denoted by 1) or not deprived (denoted by 0) in each of the indicators based on their achievement (or lack thereof) in the respective first order cutoffs for each indicator.

For example, if an 18-year-old individual (referred to as A for the sake of simplicity) has 3 years of schooling, she does not meet the first order cutoff for the indicator on years of schooling (any individual aged 10 years or older must have at least 6 years of schooling). Therefore, A is considered deprived in the indicator for years of schooling and assigned a score of 1 for that indicator. Conversely, individual B has 7 years of schooling and is 12 years old, therefore B is assigned a score of 0 for the indicator on years of schooling. This process is repeated for each indicator until individuals A and B have been assigned a score for all indicators.

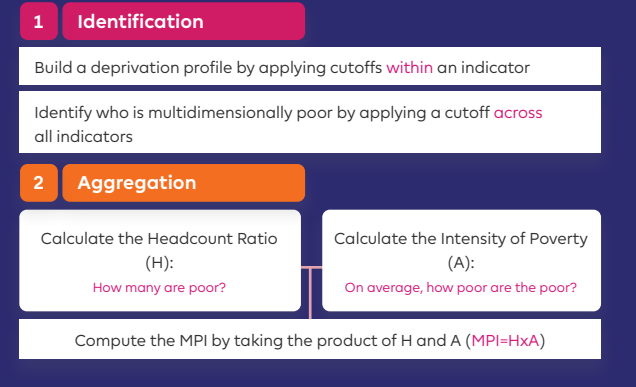

The next step is to determine the counting vector also known as the deprivation score for the individual. The deprivation score is the sum of the weighted status of all the indicators for an individual.

Extending the previous example, individual A is deprived in the indicator for years of schooling. The weighted status of the indicator for A would then be 1 (the number assigned to her denoting that she is

Note to the Reader

In order to facilitate ease of reading, the section on the computation of the MPI has been divided into two columns, the left column provides the descriptive overview of the process of arriving at India's national MPI and its various partial indices while the right column provides the associated mathematical notations and illustrations for the concepts provided in the left column.

Steps in Computing the MPI

Deprivation Status

If the achievement of an individual i in indicator j is denoted by x_{ij} , the first order cutoff for indicator j is denoted by z_j , and the status of the individual is denoted as g_{ij}^0 , then

$$g_{ij}^0 = 1 \text{ if } x_{ij} < z_j \text{ \& } g_{ij}^0 = 0 \text{ otherwise for all } i=1,2,\dots,n \text{ \& } j=1,2,\dots,d$$

Example: Finding g_{ij}^0 for Individual A

Individual	Indicator	Deprived?	Status (g_{ij}^0)
A	Has 6 years of schooling	No	0
	Does not have 6 years of schooling	Yes	1

deprived) multiplied by 1/6 (which is the weight assigned to the indicator for years of schooling. Thus, A's weighted status for indicator on years of schooling would be 1/6 or 0.166. Following this, the weighted status for individual B would be 0. This is repeated for all the indicators following which the weighted scores are added, giving us the deprivation scores for A and B. Because the weight structure follows the AF methodology, the sum of the relative weights of all the indicators equals to 1.

3.4.1.ii Poverty Cutoff

The second-order cutoff (k), defined in the AF methodology as the poverty cutoff is the deprivation score which is the identifier for multidimensional poverty. Individuals with a deprivation score greater than or equal to the second-order cutoff are identified as multidimensionally poor.

For example, if the second-order cutoff is 0.33 and individual A has a deprivation score of 0.54, then she is considered multidimensionally poor. Likewise, if individual B has a deprivation score of 0.28, she will not be considered multidimensionally poor even though she has a non-zero deprivation score.

India for its national MPI has adopted the second-order cutoff of 0.33 which is also the standard cutoff used globally. Thus, for an individual to be considered as multidimensionally poor, she should be deprived in at least 1/3rd of the weighted indicators.

It is at this juncture that the potential of the AF methodology is realized. The union method of multidimensional poverty identification considers an individual to be poor if she is deprived in even one indicator – leading to overestimation, while the intersection method only considers an individual as poor if she is deprived in all indicators, leading to underestimation. Neither of these provides any useful insights to a policy maker. The AF methodology, with its dual cutoff approach thus provides a realistic middle ground for poverty estimation.

3.4.1.iii Censoring

Following the computation of the deprivation scores for all individuals, those individuals for whom the score is less than the second order cutoff, is replaced with 0. This step is known as censoring in multidimensional poverty estimations.

Following our example, the deprivation score of individual A (0.54) will remain unaltered while the score of individual B (0.28) will be replaced with 0.

Counting Vector and Deprivation Score

The counting vector for individual i up to the j^{th} indicator (denoted by c_i), also known as deprivation score, is their status in each indicator (g_{ij}^0) multiplied by the weight (w_j) assigned to that indicator. The deprivation score (or weighted deprivation) of individual i can thus be denoted as:

$$c_i = w_1 g_{i1}^0 + w_2 g_{i2}^0 + \dots + w_j g_{ij}^0 \text{ or } c_i = \sum_{j=1}^d w_j g_{ij}^0 \text{ where } \sum_{j=1}^d w_j = 1$$

Example: Calculating the Deprivation Score for Individual A

Indicator	Deprived?	Status (g_{ij}^0)	Weights	Score ($w_j g_{ij}^0$)
Nutrition	Yes	1	X 1/6	= 0.16
Child & Adolescent Mortality	No	0	X 1/12	= 0
Maternal Health	Yes	1	X 1/12	= 0.08
Years of Schooling	Yes	1	X 1/6	= 0.16
School Attendance	No	0	X 1/6	= 0
Cooking Fuel	Yes	1	X 1/21	= 0.04
Sanitation	No	0	X 1/21	= 0
Electricity	No	0	X 1/21	= 0
Drinking Water	No	0	X 1/21	= 0
Housing	Yes	1	X 1/21	= 0.04
Assets	No	0	X 1/21	= 0
Bank Account	No	0	X 1/21	= 0
Deprivation Score (c_i)				= 0.48

Applying the Poverty Cut-off

The identification function for multidimensional poverty is denoted by p . The function p is dependent on the deprivation status of an individual (x_i) given the cutoffs within an indicator (z) as well as on the cutoffs across indicators (k) and is therefore represented by: $p_k(x_i; z) = 1$ if $c_i \geq k$ and $p_k(x_i; z) = 0$ otherwise. Therefore, the function p considers an individual i as multidimensionally poor when her deprivation score (c_i) is greater than or equal to the second-order cutoff (k).

Example: Applying the Poverty-Cutoff

Individual	Deprivation Score (c_i)	Higher than 0.33? ($c_i \geq k$)	Is MPI Poor?	Score $p_i(x_i; z)$
Individual A	0.48	Yes	Yes	1
Individual B	0.20	No	No	0

Censored Deprivation Scores

Censored scores are denoted as $c_i(k)$ to differentiate them from deprivation scores c_i . Thus, if $c_i < k$, then $c_i(k) = 0$ and if $c_i \geq k$ then $c_i(k) = c_i$. Thus, $c_i(k)$ is the deprivation score of the multidimensionally poor.

Example: Censoring in MPI

Individual	Deprivation Score (c_i)	Higher than 0.33? ($c_i \geq k$)	Is MPI Poor?	Censored Deprivation Score ($c_i(k)$)
Individual A	0.48	Yes	Yes	0.48
Individual B	0.20	No	No	0

3.4.2 Headcount Ratio

Following the identification of multidimensionally poor individuals, the next step is to determine the proportion of multidimensionally poor individuals in the total population. This is known as the headcount ratio of multidimensional poverty or the incidence of poverty and is the first of two partial indices used to determine the MPI. The headcount ratio (denoted by H) answers the question ‘how many are poor?’ India’s national MPI identifies 25.01 percent of the population as multidimensionally poor.

Headcount Ratio

$$H = \frac{q}{n}$$

where q is the total number of multidimensionally poor individuals identified (i.e., the total number of individuals for whom $p_x(x_i; z) = 1$) and n is the total population. In this report, the headcount ratio has been reported as a percentage ($H \times 100$).

3.4.2.i Uncensored (Raw) Headcount Ratio

While the headcount ratio (H) provides the proportion of multidimensionally poor individuals in the population, the uncensored headcount ratio (denoted by h_j) provides the proportion of individuals who are deprived in an indicator j irrespective of whether they are multidimensionally poor or not.

Uncensored Headcount Ratio

$$h_j = \frac{1}{n} \sum_{i=1}^n g_{ij}^0$$

where $\sum_{i=1}^n g_{ij}^0$ denotes the sum of the deprivation status up to the i^{th} individual for the indicator j and n is the total population. In this report, the uncensored headcount ratios have been reported as percentages ($h_j \times 100$).

The uncensored headcount ratios of the indicators in India’s MPI have been provided in Figure 2. Each bar represents the percentage of India’s population who are deprived in that indicator.

3.4.2.ii Censored Headcount Ratio

Akin to its uncensored counterpart, the censored headcount ratio (denoted by $h_j(k)$) provides the proportion of individuals who are multidimensionally poor and deprived in an indicator j .

Censored Headcount Ratio

$$h_j(k) = \frac{1}{n} \sum_{i=1}^n g_{ij}^0(k)$$

where n is the total population, and $g_{ij}^0(k)$ is the censored deprivation score of individual i in indicator j using a second-order cutoff (k) of 33.33 percent. In this report, the censored headcount ratios have been reported as percentages ($h_j(k) \times 100$).

The censored headcount ratios of the indicators in India’s MPI have been provided in Figure 3. Each bar represents the percentage of individuals who are multidimensionally poor and are deprived in that indicator.

3.4.3 Intensity of Poverty

The intensity of poverty (denoted by A) is the average proportion of deprivations which is experienced by multidimensionally poor individuals. It is the average deprivation score of all multidimensionally poor individuals. A is the second partial index used in the construction of the MPI and answers the question how poor are the poor?

Intensity

$$A = \frac{1}{q} \sum_{i=1}^q c_i(k)$$

Where $c_i(k)$ is the censored deprivation score (i.e. deprivation score of multidimensionally poor individuals) up to the i^{th} individual and q is the number of multidimensionally poor individuals.

3.4.4 The MPI

The Multidimensional Poverty Index reflects both the incidence and the intensity of multidimensional poverty. The index (denoted by M_0) is the product of the two partial indices, the headcount ratio (H) and intensity (A) of multidimensional poverty. This can also be defined as the share of population that is multidimensionally poor adjusted by the intensity of deprivation.

Multidimensional Poverty Index

$$M_0 = H \times A$$

$$\text{or } H \times A = \frac{q}{n} \times \frac{1}{q} \sum_{i=1}^q c_i(k) = \frac{1}{n} \sum_{i=1}^q c_i(k) = \frac{1}{n} \sum_{i=1}^q \sum_{j=1}^d w_j g_{ij}^0(k)$$

The MPI, therefore, is the share of weighted deprivations faced by multidimensionally poor individuals divided by the total population. The MPI is therefore known as the adjusted headcount ratio.

Figure 2: Uncensored Headcount Ratio

Percentage of the total population of India who are deprived in each indicator

Note on comparison: The striped bars denote the provisional estimates for the uncensored headcount ratio based on the data available in the NFHS-5 India Factsheet (2019-20).

Figure 3: Censored Headcount Ratio

Percentage of total population of India who are multidimensionally poor and deprived in each indicator

Dimension: Health (Green), Education (Blue), Standard of Living (Pink), NFHS-5: Standard of Living (Striped Pink)

3.4.4.i Why is the adjustment important?

An understandable question at this point would be as to why the adjustment (using the intensity of poverty) is required when the headcount ratio already identifies who is multidimensionally poor.

Traditionally, poverty measures (such as poverty lines) would utilize a single threshold to determine if an individual was poor or not. However, this would only convey the information regarding number of people in poverty but not the extent of their poverty.

Therefore, any change in the level of deprivations (for better or for worse) faced by an individual in poverty would not affect the poverty measure unless the change was substantial enough to make the individual cross the determined poverty threshold.

To put it in simpler terms, traditional poverty measures would remain unaltered if an individual who is already poor became poorer, or an individual who is poor became less poor but not enough to cross the

poverty line. This means that these measures do not adhere to the axiom of dimensional monotonicity in poverty measurement i.e., if the number of deprivations faced by poor individuals decreases, then the overall poverty measure should also decrease and vice versa.

M_0 (or the MPI) estimated by the AF methodology is dependent both on the headcount ratio as well as the intensity of poverty, and therefore may change if the headcount ratio decreases/ increases (i.e. the absolute number of people in poverty decreases/ increases) or if the deprivations faced by multidimensionally poor individuals decrease/ increase (which may happen without changing the headcount ratio). Therefore, the MPI adheres to the axiom of dimensional monotonicity.

Thus, for policy makers the MPI presents a responsive measure that improves not only when the absolute number of individuals in poverty decreases, but also when the severity of poverty experienced by a multidimensionally poor individual decreases.

3.5 Deconstruction of Estimates & Indicators

One of the defining characteristics of the AF methodology is sub-group decomposability, i.e. breaking down estimates by sub-groups such as geographical region and population groups. The AF methodology also allows for deconstruction by indicators that can allow the determination of the contribution of each indicator to the MPI. This contribution can be determined for the total population as well as for each sub-group. This ability to “drill-down” through the estimates lends importance to the MPI at every administrative level in India, from the Union Government, the State Government and even the district administration.

3.5.1 Estimates by geographical level and population sub-groups

In order to arrive at the estimates for the headcount ratio, intensity and the adjusted headcount ratio (and the sub-components under the same), each sub-group is treated as the total population over which the estimates are computed.

For example, when computing the estimates for District i , we will take all households in District i and compute the MPI like we would do for the total population, i.e., we will carry out the end to end process of assigning deprivation scores, applying the second-order cutoff, determining who is multidimensionally poor and compute the aggregate estimates for only the population in District i .

Similarly, if we would like to look even further and determine the estimates for the rural areas within District i , then we would carry out the identification and aggregation process for only the population living in the rural area within District i .

It would be prudent to note that a simple average of sub-group estimates will not provide the estimate for the parent group. Thus, taking the average of district MPIs for a state will not provide the state MPI, nor will taking the average of state MPIs provide the national MPI. Only the population weighted sum of the sub-group MPIs will provide the MPI for the larger group it is a part of.

3.5.2 Contribution of Indicators

The MPI can be deconstructed into its component censored indicators. Therefore, we can not only look at the MPI for a certain sub-group, but we can also look at the factors (i.e., indicators) which are contributing to multidimensional poverty for that sub-group.

Disaggregations in this Report

The Baseline Report on the MPI Provides:

National, State and District level estimates of Headcount Ratio, Intensity and the MPI based on the NFHS-4.

Uncensored and Censored Headcounts for 12 indicators of the national MPI up to the level of the Districts

Contribution of each of the 12 indicators to India's MPI Score up to the level of the Districts

Headcount Ratio, Intensity and the MPI for Urban and Rural areas upto the level of the Districts

Estimates for a Region: Example, Headcount Ratio

$$H_i = \frac{q_i}{n_i}$$

where q_i is the total number of multidimensionally poor individuals in region i , where i can be any region of interest such as a State, a District, and even urban or rural areas within a selected State or District. Intensity of poverty will then include the average deprivations experienced by the multidimensionally poor individuals in region i .

Dissaggregation by Urban and Rural Areas

Let us assume that the MPI for District i is MPI_i and the MPI for the urban and rural areas within District i is MPI_{iu} and MPI_{ir} , therefore,

$$MPI_i = \frac{n_{iu}}{n_i} MPI_{iu} + \frac{n_{ir}}{n_i} MPI_{ir}$$

Where n_i denotes the total population in District i , n_{iu} is the population living in the urban areas of District i , and n_{ir} is the population living in the rural areas of District i assuming that $n_i = n_{iu} + n_{ir}$.

Dissaggregation by Districts

Taking the above example forward, if we wish to arrive at the MPI for India from the MPI of the 640 districts in India's national MPI, then:

$$MPI_c = \frac{n_1}{n} MPI_1 + \frac{n_2}{n} MPI_2 + \dots + \frac{n_i}{n} MPI_i$$

$$\text{or } MPI_c = \frac{1}{n} \sum_{i=1}^{640} n_i MPI_i$$

Where, MPI_c and n are India's MPI and population respectively, MPI_i and n_i are the MPI and population for the i^{th} district with i taking a value up to 640, equivalent to the number of districts in the country as of 2011.

Example: Calculating the Headcount Ratio, Intensity and MPI for 3 Households

Indicator	HH1	HH2	HH3	Weights	=	HH1	HH2	HH3
	7 members Status (g_{ij}^*)	5 members Status (g_{ij}^*)	4 members Status (g_{ij}^*)			Score ($w_j g_{ij}^*$)	Score ($w_j g_{ij}^*$)	Score ($w_j g_{ij}^*$)
Nutrition	1	1	0	X 1/6	=	0.16	0.16	0
Child & Adolescent Mortality	0	0	1	X 1/12	=	0	0	0.08
Maternal Health	1	1	1	X 1/12	=	0.08	0.08	0.08
Years of Schooling	1	1	0	X 1/6	=	0.16	0.16	0
School Attendance	1	0	0	X 1/6	=	0.16	0	0
Cooking Fuel	1	1	1	X 1/21	=	0.04	0.04	0.04
Sanitation	1	0	0	X 1/21	=	0.04	0	0
Electricity	0	0	0	X 1/21	=	0	0	0
Drinking Water	0	0	0	X 1/21	=	0	0	0
Housing	1	1	0	X 1/21	=	0.04	0.04	0
Assets	0	0	0	X 1/21	=	0	0	0
Bank Account	0	0	0	X 1/21	=	0	0	0
Deprivation Score (c_i)						0.68	0.48	0.20
Censored Deprivation Score ($c_i(k)$)						0.68	0.48	0

Members of HH1 and HH2 are multidimensionally poor

Headcount Ratio

The Headcount Ratio is computed by dividing the total number of multidimensionally poor (q) by the total population (n)

$$H = \frac{q}{n} = \frac{7+5}{7+5+4} = \frac{12}{16} = 0.75$$

In this illustration, 75% of individuals are multidimensionally poor

Intensity of Poverty

The Intensity of multidimensional poverty is computed by summing the weighted deprivation scores of all the MPI poor divided by the total number of MPI poor

$$A = \frac{1}{q} \sum_{k=1}^n c_i(k) = \frac{0.68 \times 7 + 0.48 \times 5}{7+5} = 0.596$$

On an average, an MPI poor individual is deprived in 59% of weighted indicators

Multidimensional Poverty Index

The MPI score is the product of the headcount ratio and intensity. It is known as the adjusted headcount ratio

$$MPI = H \times A = 0.75 \times 0.596 = 0.447$$

The contribution of indicators is determined by dividing the weighted censored headcount ratio for each indicator by the MPI. This is multiplied by 100 to arrive at the percentage contribution.

Analogous to the process of disaggregation by geographical and population sub-groups, the contribution of each region (e.g. how much does a district contribute to the national figure) or of each population group (e.g. how much does female/male poverty contribute to the national figure) can be computed through the method illustrated, where the weighted censored headcounts is replaced by the population weighted MPI for the sub-group.

3.5.2.i Why is looking at contributions important?

The contribution of an indicator provides an insight into the relative deprivation in a particular indicator based on the weight attached to that indicator. When looking at the censored or uncensored headcount ratios, we can gauge, in absolute terms, how many individuals in the total population are deprived in an indicator (for uncensored) and how many multidimensionally poor individuals are deprived in an indicator (for censored).

However, a high percentage of absolute deprivation in an indicator may not result in a high MPI. While the number of individuals experiencing joint deprivations

Determining the Contribution of an Indicator

The process for determining the contribution of an indicator is a derivative of the fact that the sum of weighted censored headcount ratios for all indicators provides us with the MPI.

As shown earlier, the censored headcount ratio is represented as $h_j(k)$ where j is the indicator and k is the second-order cutoff at which the censoring was done. Therefore,

$$MPI_c = w_1 h_1(k) + w_2 h_2(k) + \dots + w_j h_j(k)$$

$$\text{or } MPI_c = \sum_{j=1}^{12} w_j h_j(k)$$

Where, MPI_c is India's MPI, w_j is the weight of the j^{th} indicator with j taking a value up to 12 - equivalent to the number of indicators in India's national MPI. Thus, the contribution of each indicator j is,

$$\text{Contribution}_j = \frac{w_j h_j(k)}{MPI_c} \times 100$$

Dimension	Indicator	Uncensored Headcount	Censored Headcount (CH)	Weight (W)	Contribution
Health	Nutrition	37.60%	19.90%	1/6	28.14%
	Child-Adolescent Mortality	2.69%	1.88%	1/12	1.33%
	Maternal Health	22.59%	14.71%	1/12	10.40%
Education	Years of Schooling	13.88%	10.71%	1/6	15.14%
	School Attendance	6.40%	5.23%	1/6	7.39%
Standard of Living	Cooking Fuel	58.48%	23.13%	1/21	9.34%
	Sanitation	51.97%	21.32%	1/21	8.61%
	Drinking Water	14.60%	5.53%	1/21	2.23%
	Electricity	12.16%	8.29%	1/21	3.35%
	Housing	45.65%	20.56%	1/21	8.31%
	Assets	13.97%	8.87%	1/21	3.58%
	Bank Account	9.66%	5.37%	1/21	2.17%
MPI (M_j) = Sum of (CH × W) = 0.118					

FIGURE 4: CONTRIBUTION OF INDICATORS TO INDIA'S MPI SCORE

across multiple indicators is one of the determinant factors of the MPI, the weights assigned to those indicators also play an important role. In order to understand this with more clarity, we can look at Figure 4 that portrays the uncensored headcount, censored headcount, and contribution for each indicator in India's national MPI.

Taking the case of the indicator for maternal health, one can see that the uncensored headcount (i.e., percentage of total population) deprived is 22.59 percent. Similarly, 14.71 percent of multidimensionally poor individuals are deprived in maternal health. However, the contribution of the indicator to the MPI is 10.40 percent. Similarly, for the indicator for years of schooling, the converse can be observed with both censored and uncensored headcounts being lower than the contribution to the MPI score. Therefore, in order to arrive at an objective assessment of poverty it is important to consider all three factors:

- I. The uncensored headcount gives us the absolute number of individuals who are deprived in an indicator; it gives us the status of deprivations among the entire population.
- II. The censored headcount gives us the proportion of individuals who are multidimensionally poor and deprived in an indicator; it gives us the composition of deprivations among the multidimensionally poor.
- III. The contribution of an indicator gives us the percentage contribution of an indicator to the overall MPI considering the weights attached to each indicator.

From the point of view of a policy maker, the uncensored headcount outlines the broader priorities for intervention required for the benefit of the entire population, the censored headcount outlines the immediate priorities required for the benefit of the multidimensionally poor population, and the contribution outlines where interventions would lead to the reduction of the overall MPI of the population.

3.6 The Data Source & Unit of Analysis

The MPI captures the multiple deprivations faced by an individual and by extension, a household. These deprivations lie across a broad spectrum of domains such as health, education, access to basic infrastructure, and ownership of assets, to name a few. The aim of the MPI is therefore to identify the various set of indicators in which an individual is deprived at the same time. Thus, the prerequisite for the construction of the MPI is that all the data required for it, must come

from the same single survey, otherwise the creation of household deprivation profiles will not be possible. Therefore, it is neither possible nor feasible to collate data on a single household from several different surveys i.e., health indicators from the different rounds of National Sample Surveys, education indicators from the National Achievement Surveys etc.

3.6.1 The National Family Health Survey

The globally established practice is to use the Demographic and Health Surveys (DHS) in countries where it is available, for the computation of the MPI. This has several benefits, as the DHS allows for cross-country comparisons, can be disaggregated at multiple levels by geography or by population sub-groups, and most importantly, collects data across all the dimensions critical to the computation of the MPI. The DHS for India is the National Family Health Survey (NFHS), which is conducted by the International Institute for Population Sciences (IIPS) under the aegis of the Ministry of Health and Family Welfare (MoHFW), Government of India. This is the baseline report for India's national MPI, and has been computed using the data from the 4th round of the NFHS conducted in 2015-16. The NFHS-4 captures the data for 28,69,043 individuals across 6,28,892 households. The data is representative at the national, state and district levels, and can be further disaggregated into urban and rural areas to provide granular estimates. The NFHS covers all States and Union Territories and provides data for 640 administrative Districts defined in the 2011 census.

The national MPI will be updated upon the release of the data for the 5th round of the NFHS conducted in 2019-20.

3.6.2 The Unit of Identification & Analysis

The unit of identification, i.e., the entity that is identified as poor or non-poor for India's national MPI is the household. The information for all members in a household is considered altogether. Therefore, all members in a household are assigned the same deprivation scores. This also acknowledges the intra-household positive or negative externalities in factors such as nutrition, maternal health and education.

The unit of analysis i.e., the unit for analyzing and reporting of the results is the individual. Therefore, the headcount ratio provides the percentage of individuals who are poor rather than the percentage of households who are poor. This approach treats every individual as equal in terms of reporting and differential treatment of the deprivations faced by individuals within the same household.

CHAPTER 4

WAY FORWARD REFORMS & PROGRESS

This baseline National MPI Report and Dashboard is a landmark first step in bringing multidimensional poverty as a tool to the policy table at the national and subnational levels in India. It is expected that the report will play an instrumental role in sensitizing government, researchers, civil society, citizens, and other stakeholders on the need for and importance of MPI as a powerful policy instrument. At the higher levels, MPI could be used as an input to the design of development policies schemes, budget allocations, and target setting. At the lower levels, for instance, of that of district, MPI could decide priority of execution and delivery. With every revision of MPI based on new survey data, actions could be redesigned to shift focus to those who need it the most. NITI Aayog will play a key role in charting this path and supporting the stakeholders in their actions, through the following approaches.

4.1 Trend analysis based on estimates from NFHS-5

While this report is an indispensable first step in mainstreaming MPI, it is based on a dataset which is five years old. The success of numerous development interventions in the recent past have resulted in progress in key parameters on health, education, and standard of living. For instance, saturation of village electrification and toilets was achieved in 2018 and 2019, respectively. The NFHS-5, conducted during

2019-20, is expected to capture the progress achieved in these areas. The unit-level data of the survey required for MPI estimations is likely to be published before the end of 2021, based on which the national MPI figures will be revised, at the national, State/UT, and district levels. A trend analysis, using the two datasets, will also be carried out. This will clearly point out areas of focus for the near future. The decision to conduct subsequent National Family Health Surveys once in every three years will increase the frequency of MPI revisions and reduce the lag in the reflection of development outcomes in poverty estimates. A higher frequency of NFHS will also address the issue of stagnation of India's global rankings in MPI and reflect the improvements adequately. Corresponding to the revision of MPI estimates, the MPI dashboard, which will present national, State, and district-level MPI and related figures, will be updated.

4.2 Reform action plan for the States/UTs

Between two consecutive NFH Surveys, focused government action to fill the gaps and reduce deprivations will result in improved outcomes. The reform action plan is a tool designed to support the States in this crucial endeavor. The plan maps the government schemes and policies which have a direct bearing on the health, education, and living standards outcomes which MPI captures, to each national MPI indicator. Further, the plan also identifies indicators under these

schemes and programmes whose achievements are directly and positively correlated with MPI outcomes. This implies that progress, as measured by these indicators, will result in improvement of the corresponding national MPI indicators. To demonstrate, one of the indicators in the reform action plan, under the "nutrition" indicator of national MPI, is "number of Anganwadi Centres having weighing scales as a proportion of total number of Anganwadi Centres", which is mapped to the ICDS scheme. Improvement as measured under this indicator will result in better monitoring of nutritional outcomes by the AWCs which will in turn trigger action to improve nutrition, whose success will consequently bring about reduction in levels of malnutrition. This change will result in reduction of deprivation under the "nutrition" indicator of the national MPI, leading to a better MPI score, *ceteris paribus*.

While NITI Aayog has prepared a template for the reform action plan through consultations with central ministries, it is important to note that the States are being encouraged to suitably modify it, taking into account their realities, development challenges, and priorities. Though national MPI measures outcomes, the reform action plan will invariably consist of administrative and input indicators. The idea is that these input indicators will act as high-frequency proxies for the outcome indicators. In the coming months, NITI Aayog aims to support the States in developing effective reform action plans which will periodically capture progress under development programmes and schemes, and contribute to reduction in deprivations and multidimensional poverty.

4.3 Progress dashboard

While the periodic NFH Surveys will measure outcomes and will be used for revising MPI estimates, there is a need to strengthen implementation which will eventually result in improved outcomes. To monitor the progress of the implementation, the Development Monitoring and Evaluation Office (DMEO), an attached office under NITI Aayog, is in the process of developing a progress dashboard.

This dashboard will track the progress of the reforms implemented by the States to improve outcomes which will eventually reflect in reduced multidimensional poverty. Though this dashboard will not monitor outcomes directly, nevertheless it plays a crucial role, as the implementation of reform actions by the States is the only way the country can achieve faster poverty reduction and correspondingly a better position in global MPI rankings.

4.4 Technical support to States

While NITI Aayog will continue to estimate and publish MPI figures based on NFHS data periodically, the States are encouraged to pursue analysis at multiple levels. Household surveys could be designed and carried out to estimate MPI at block or district levels, with higher frequency. This will offer insights into block-level estimates, which are not possible from NFHS owing to its sample design and size and deliver more frequent estimations at the district levels. The experience of the Government of Andhra Pradesh, which carried out a household survey in 2016 exclusively to estimate MPI at the State and district levels is an example in this regard. NITI Aayog has in-house capabilities and will be willing to offer technical support to the States, should they be interested in surveys for this purpose. This support could include design of indicators, sampling design, questionnaire development, training of enumerators, data cleaning, processing, and analysis, report structuring, and action plan for improvement. On one hand, this support will result in disaggregated and more frequent MPI estimates and corresponding action plans for poverty reduction, while on the other hand, it will contribute significantly to improving state capacity in poverty estimation, monitoring, and reduction.

While the aforementioned are the clear actions planned for the near future to further mainstream MPI as a powerful policy tool at the national and subnational levels, the long-term actions will depend on how the project and its associated initiatives will unfold. Depending on the acceptance at various levels, NITI Aayog will accordingly design and implement or support further initiatives to fast track the adoption of MPI. Some of this could include State-specific MPI reports, focus on disaggregated MPI etc. The utility, relevance and acceptability of a national MPI as a powerful policy tool for fast tracking development and leaving no one behind at the national and local levels, will eventually shape the discourse on developmental policy in the coming days in the country as much as in the global arena.

SECTION
III
NATIONAL
&
STATE/UT RESULTS

India

A snapshot of multidimensional poverty in India

Overview

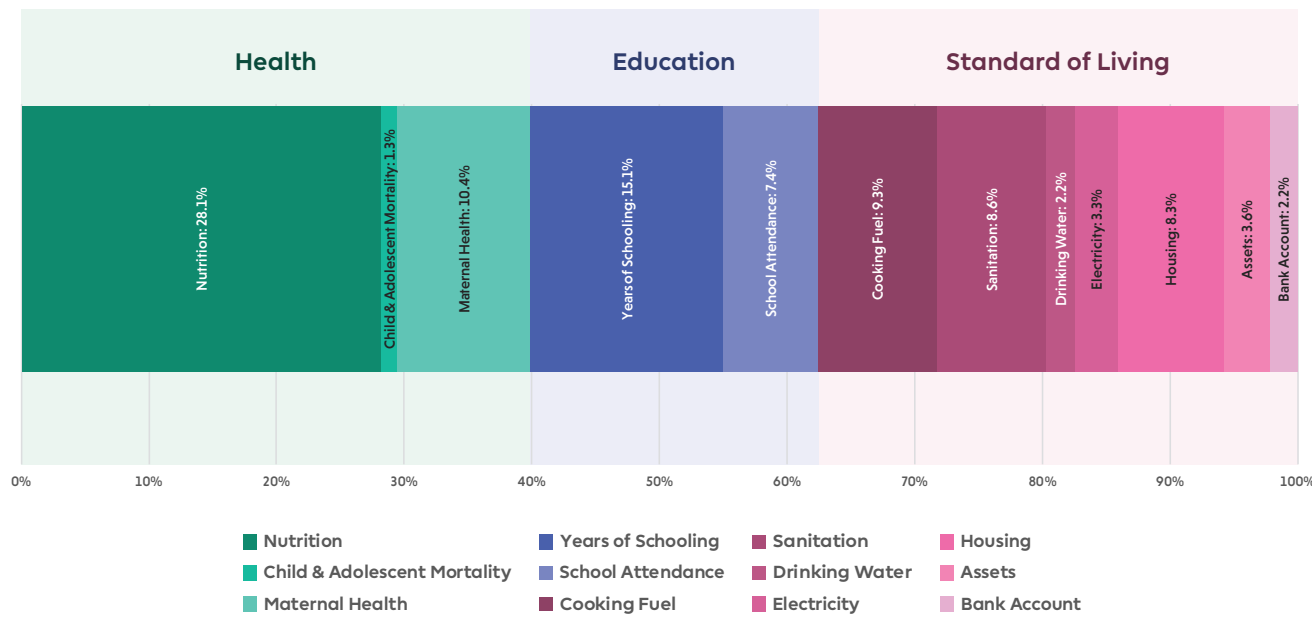

India Headcount Ratio, Intensity and MPI

Rural			Urban		
Headcount Ratio	Intensity	MPI	Headcount Ratio	Intensity	MPI
32.75%	47.38%	0.155	8.81%	45.25%	0.04

India: Indicator-wise Contribution to the MPI

Percentage contribution of each indicator to the MPI score

Note on the data period: The NFHS 4 (2015-16) precedes the full roll out of flagship schemes of Pradhan Mantri Awas Yojana (PMAY), Jal Jeevan Mission (JJM), Swachh Bharat Mission (SBM), Pradhan Mantri Sahaj Bijli Har Ghar Yojana (Saubhagya), Pradhan Mantri Ujjwala Yojana (PMUY), and the Pradhan Mantri Jan Dhan Yojana (PMJDY).

India: Uncensored Headcount Ratio

Percentage of total population who are deprived in each indicator

Note on comparison: The striped bars denote the provisional estimates of the uncensored headcount ratio based on the data available in the NFHS-5 India Factsheet (2019-20).

India: Censored Headcount Ratio

Percentage of total population who are multidimensionally poor and deprived in each indicator

India: Headcount Ratio

Percentage of population who are multidimensionally poor in each State/UT

Note on data representation: As the data period for the NFHS-4 is 2015-16, the estimates for the present Union Territories of Jammu & Kashmir, and Ladakh have been computed for their combined geographical region. Similarly, the estimates for the present Union Territory of Dadra & Nagar Haveli & Daman & Diu have been computed separately for their erstwhile regions.

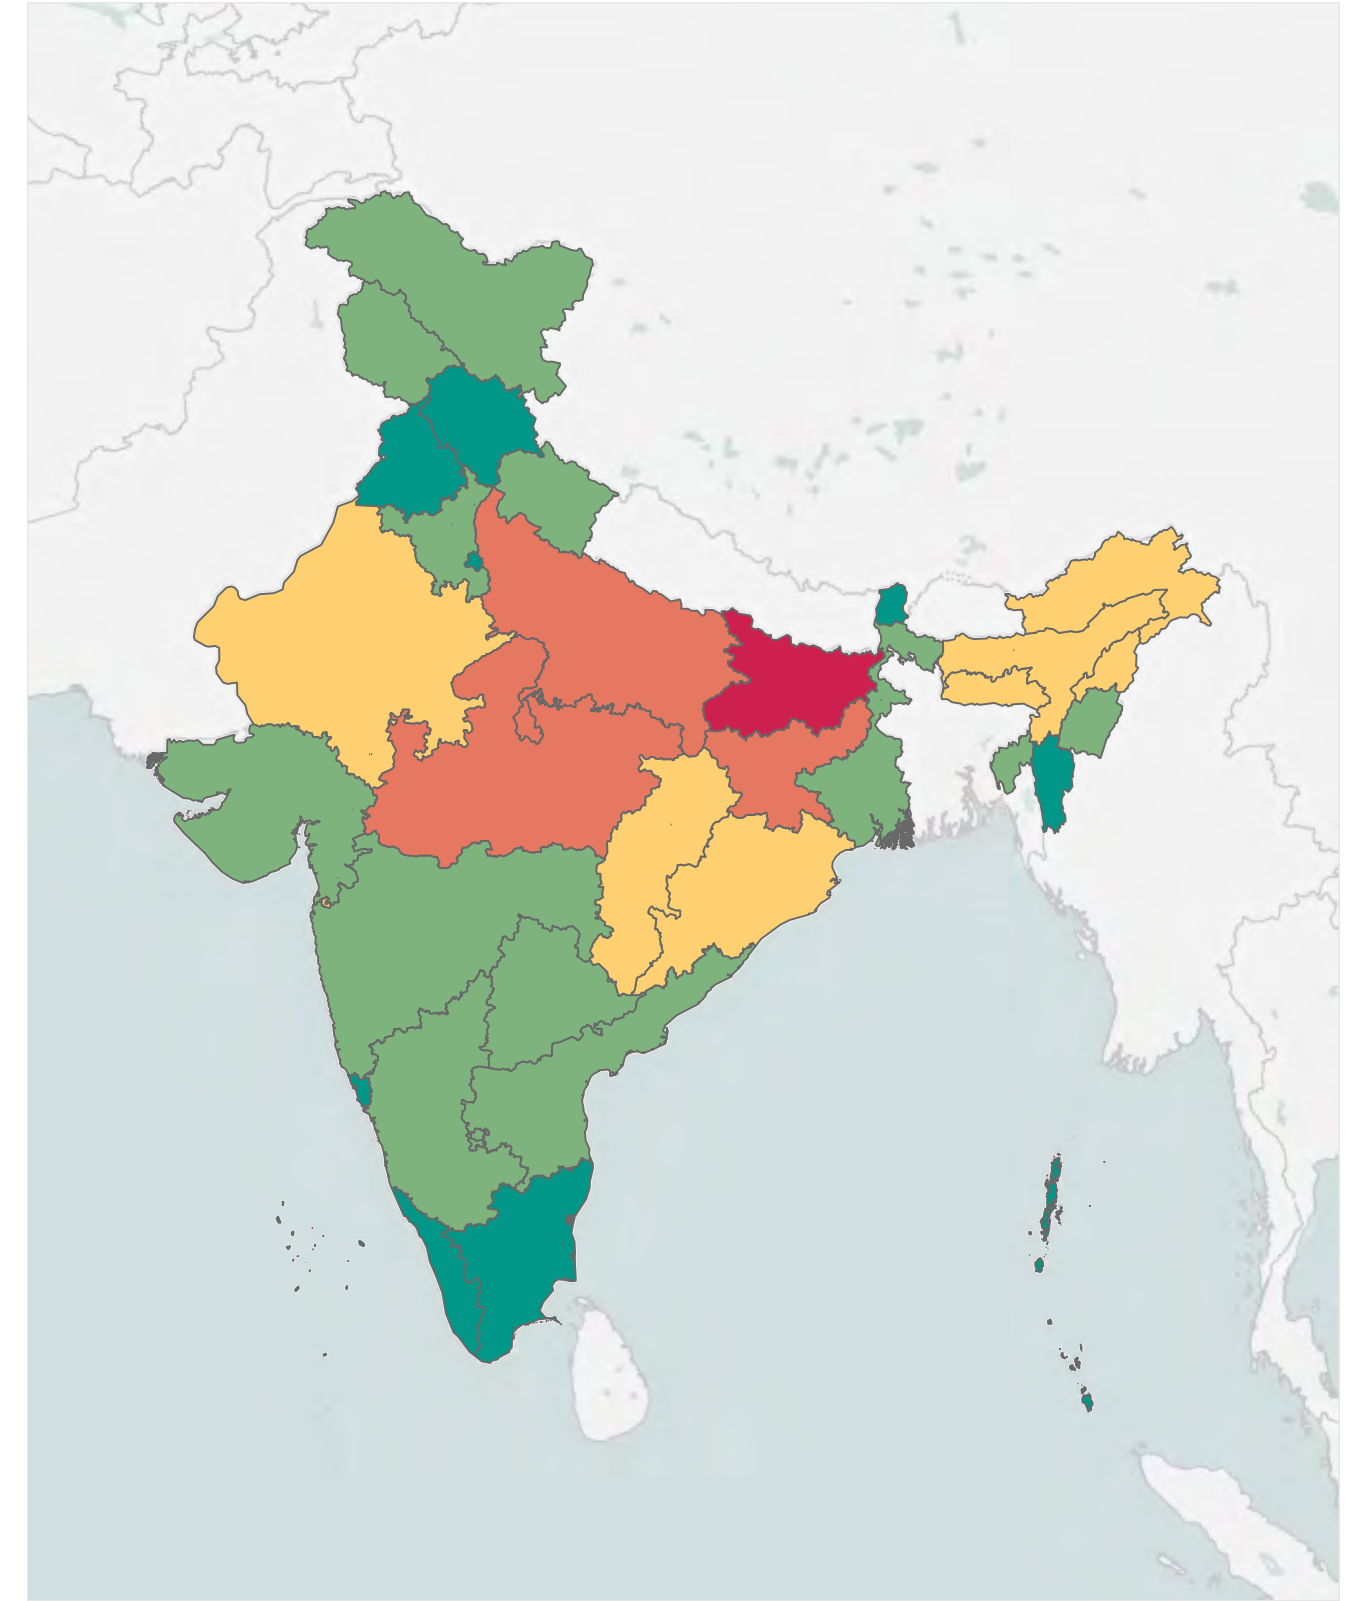

Multidimensional Poverty Index

The size of the bar represents the percentage of population who are multidimensionally poor in each State/UT of India. The colour of the bar represents the MPI score of the district. The colour moves from green, through yellow, to red as the MPI score increases. Green represents areas with the lowest MPI scores while red represents areas with the highest MPI scores. The legend provides the range of MPI scores represented by a colour.

India: States & Union Territories

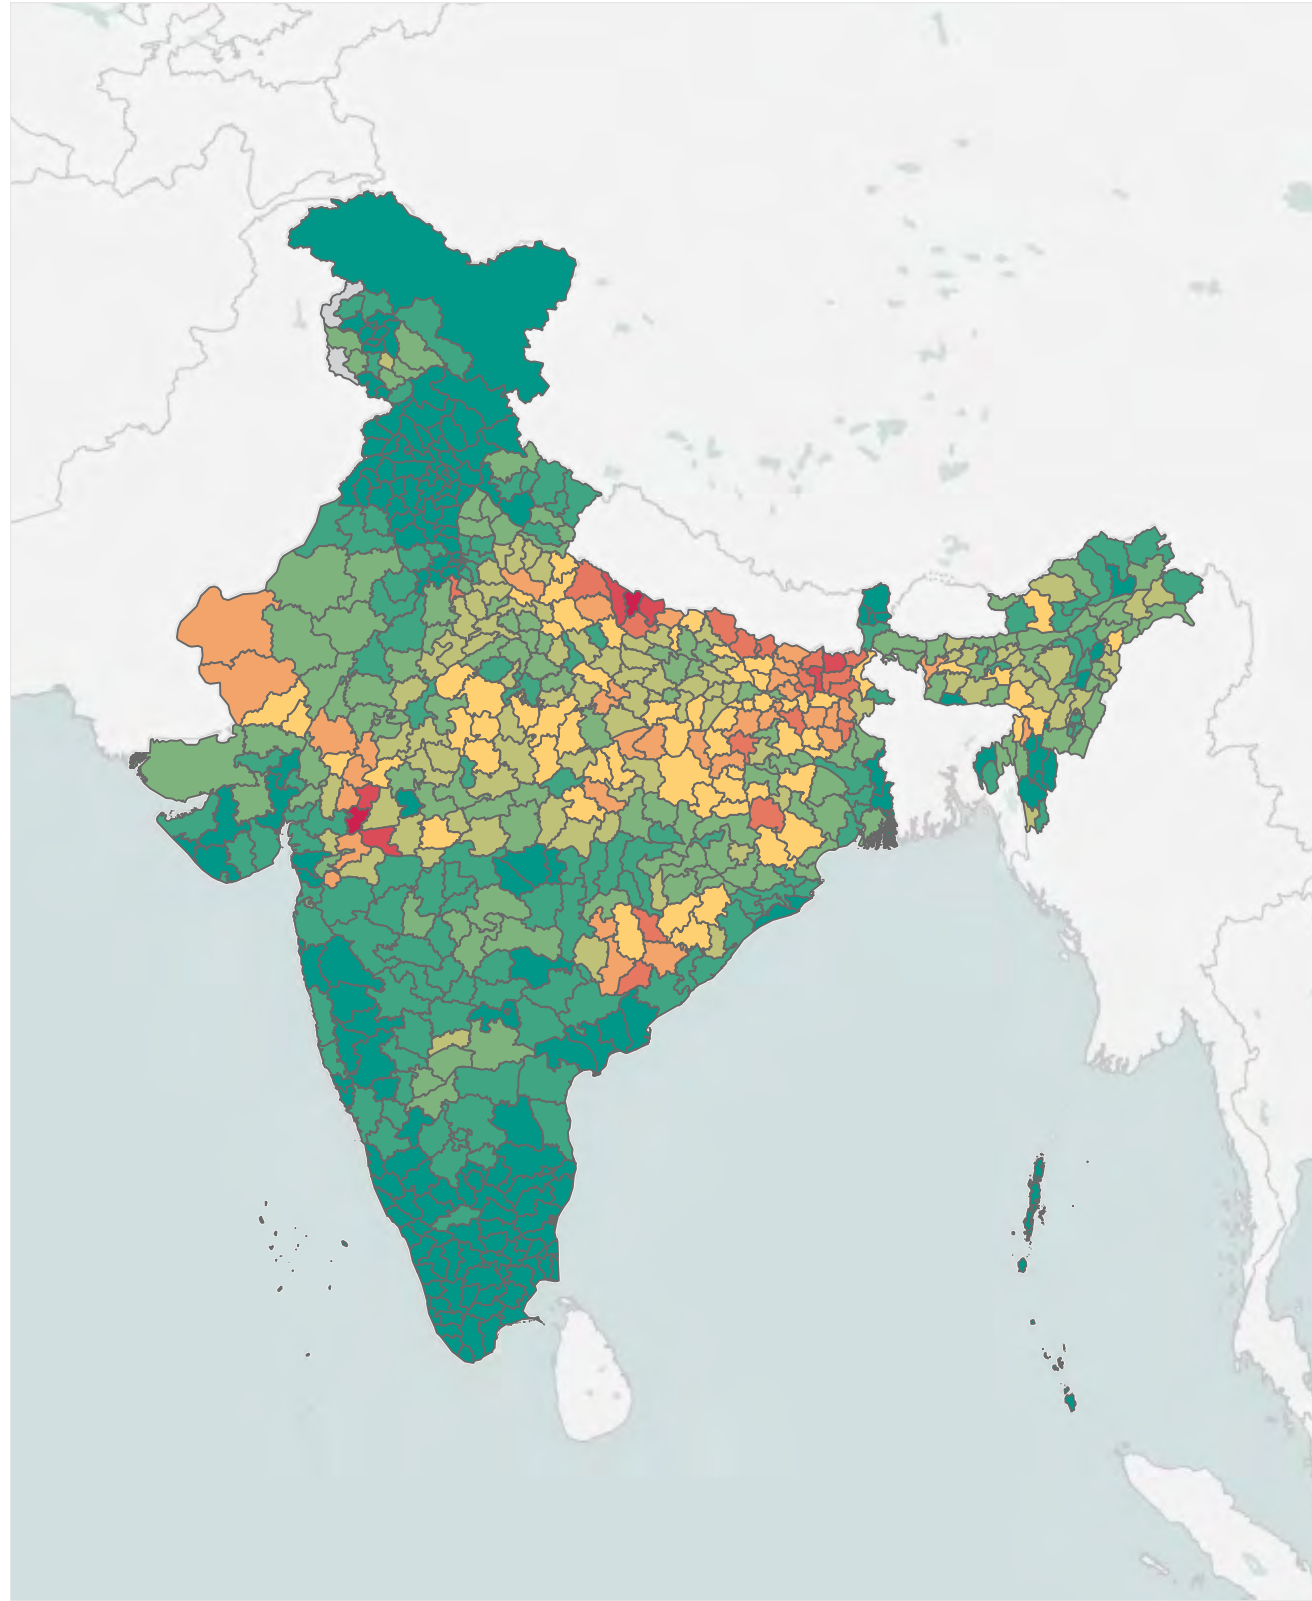

Multidimensional Poverty Index Score (State/UT-wise)

The colour represents the MPI score of a State/UT. The colour moves from green, through yellow, to red as the MPI score increases. Green represents areas with the lowest MPI scores while red represents areas with the highest MPI scores. The legend provides the range of MPI scores represented by a colour.

India: Districts

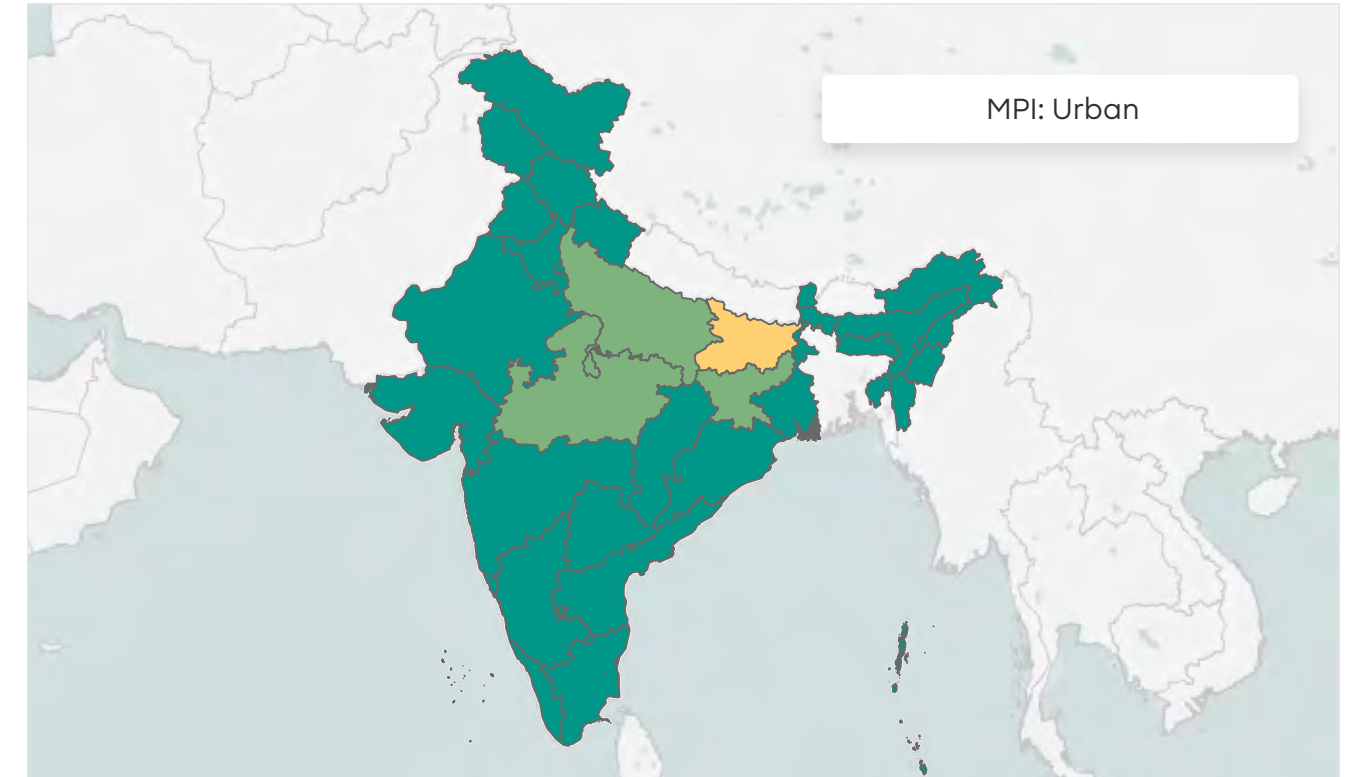

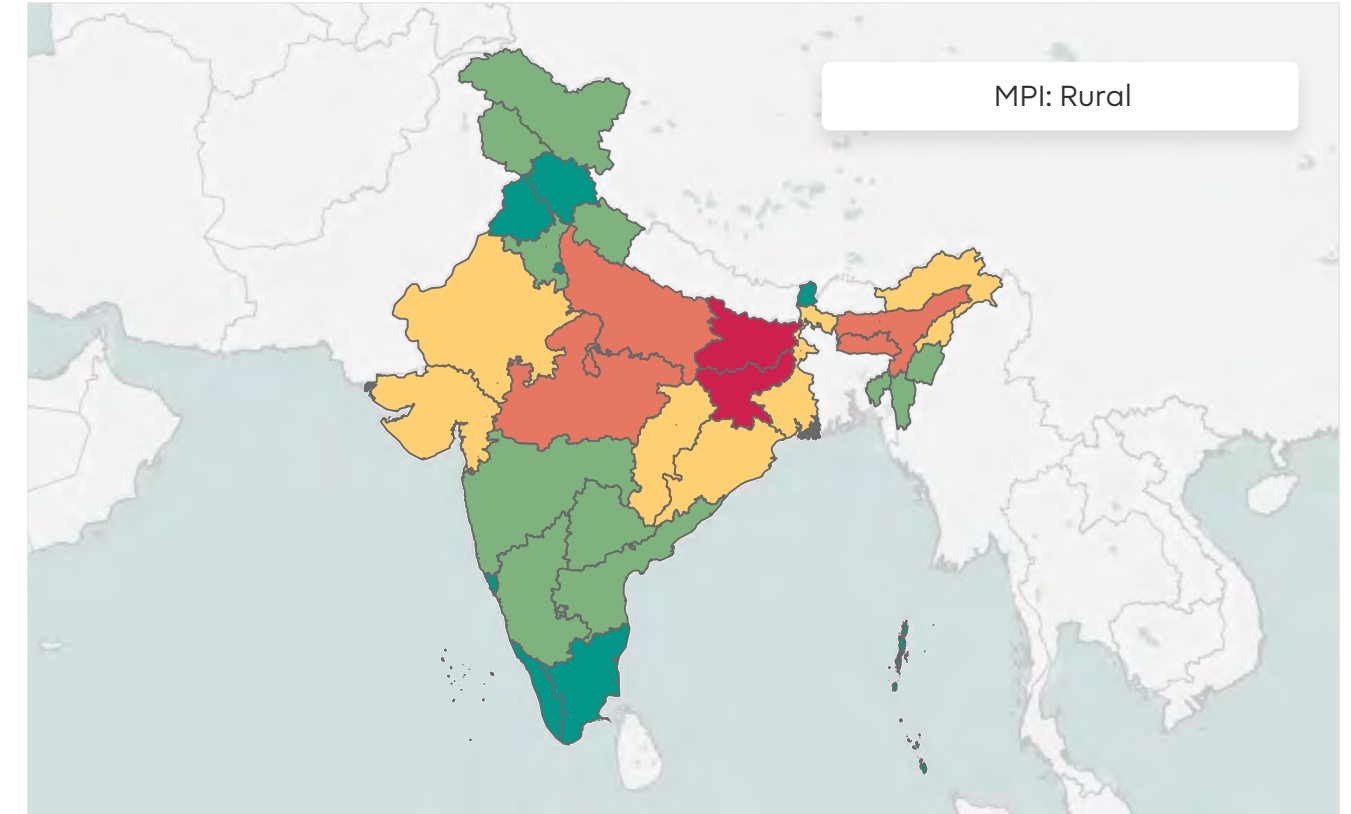

Multidimensional Poverty Index Score (District-wise)

Districts of Jammu and Kashmir, and Ladakh are as per the Political Map of India 10th Edition (Survey of India). Other districts are as per the Census of India, 2011. The colour represents the MPI score of a district. The colour moves from green, through yellow, to red as the MPI score increases. Green represents areas with the lowest MPI scores while red represents areas with the highest MPI scores. The legend provides the range of MPI scores represented by a colour. Regions with no data are shown in grey.

India: States & Union Territories

Multidimensional Poverty Index Score (Rural and Urban)

The colour represents the MPI score of a State/UT. The colour moves from green, through yellow, to red as the MPI score increases. Green represents areas with the lowest MPI scores while red represents areas with the highest MPI scores. The legend provides the range of MPI scores represented by a colour.

Uncensored Headcount: Nutrition

State/UT-wise percentage of population deprived

Definition: A household is considered deprived if any child between the ages of 0 to 59 months, or woman between the ages of 15 to 49 years, or man between the ages of 15 to 54 years -for whom nutritional information is available - is found to be undernourished.

Uncensored Headcount: Child & Adolescent Mortality

State/UT-wise percentage of population deprived

Definition: A household is deprived if any child or adolescent under 18 years of age has died in the household in the five-year period preceding the survey.

Uncensored Headcount: Maternal Health

State/UT-wise percentage of population deprived

Definition: A household is deprived if any woman in the household who has given birth in the 5 years preceding the survey has not received at least 4 antenatal care visits for the most recent birth or has not received assistance from trained skilled medical personnel during the most recent childbirth.

Uncensored Headcount: Years of Schooling

State/UT-wise percentage of population deprived

Definition: A household is deprived if not even one member of the household aged 10 years or older has completed six years of schooling.

Uncensored Headcount: School Attendance

State/UT-wise percentage of population deprived

Definition: A household is deprived if any school-aged child is not attending school up to the age at which he/she would complete class 8.
Note on comparison: The NFHS-5 provisional estimates of the uncensored headcount ratio of school attendance is based on the NFHS-5 State/UT Reports. Final estimates based on the microdata may vary.

Uncensored Headcount: Cooking Fuel

State/UT-wise percentage of population deprived

Definition: A household is deprived if the primary source of cooking fuel is dung, agricultural crops, shrubs, wood, charcoal or coal.
Note on comparison: The NFHS-5 provisional estimates of the uncensored headcount ratio of cooking fuel is based on the NFHS-5 State/UT Reports and Factsheets. Final estimates based on the microdata may vary.

Uncensored Headcount: Sanitation

State/UT-wise percentage of population deprived

Definition: The household has unimproved or no sanitation facility or it is improved but shared with other households.
Note on comparison: The NFHS-5 provisional estimates of the uncensored headcount ratio of sanitation is based on the NFHS-5 State/UT Reports and Factsheets. Final estimates based on the microdata may vary.

Uncensored Headcount: Drinking Water

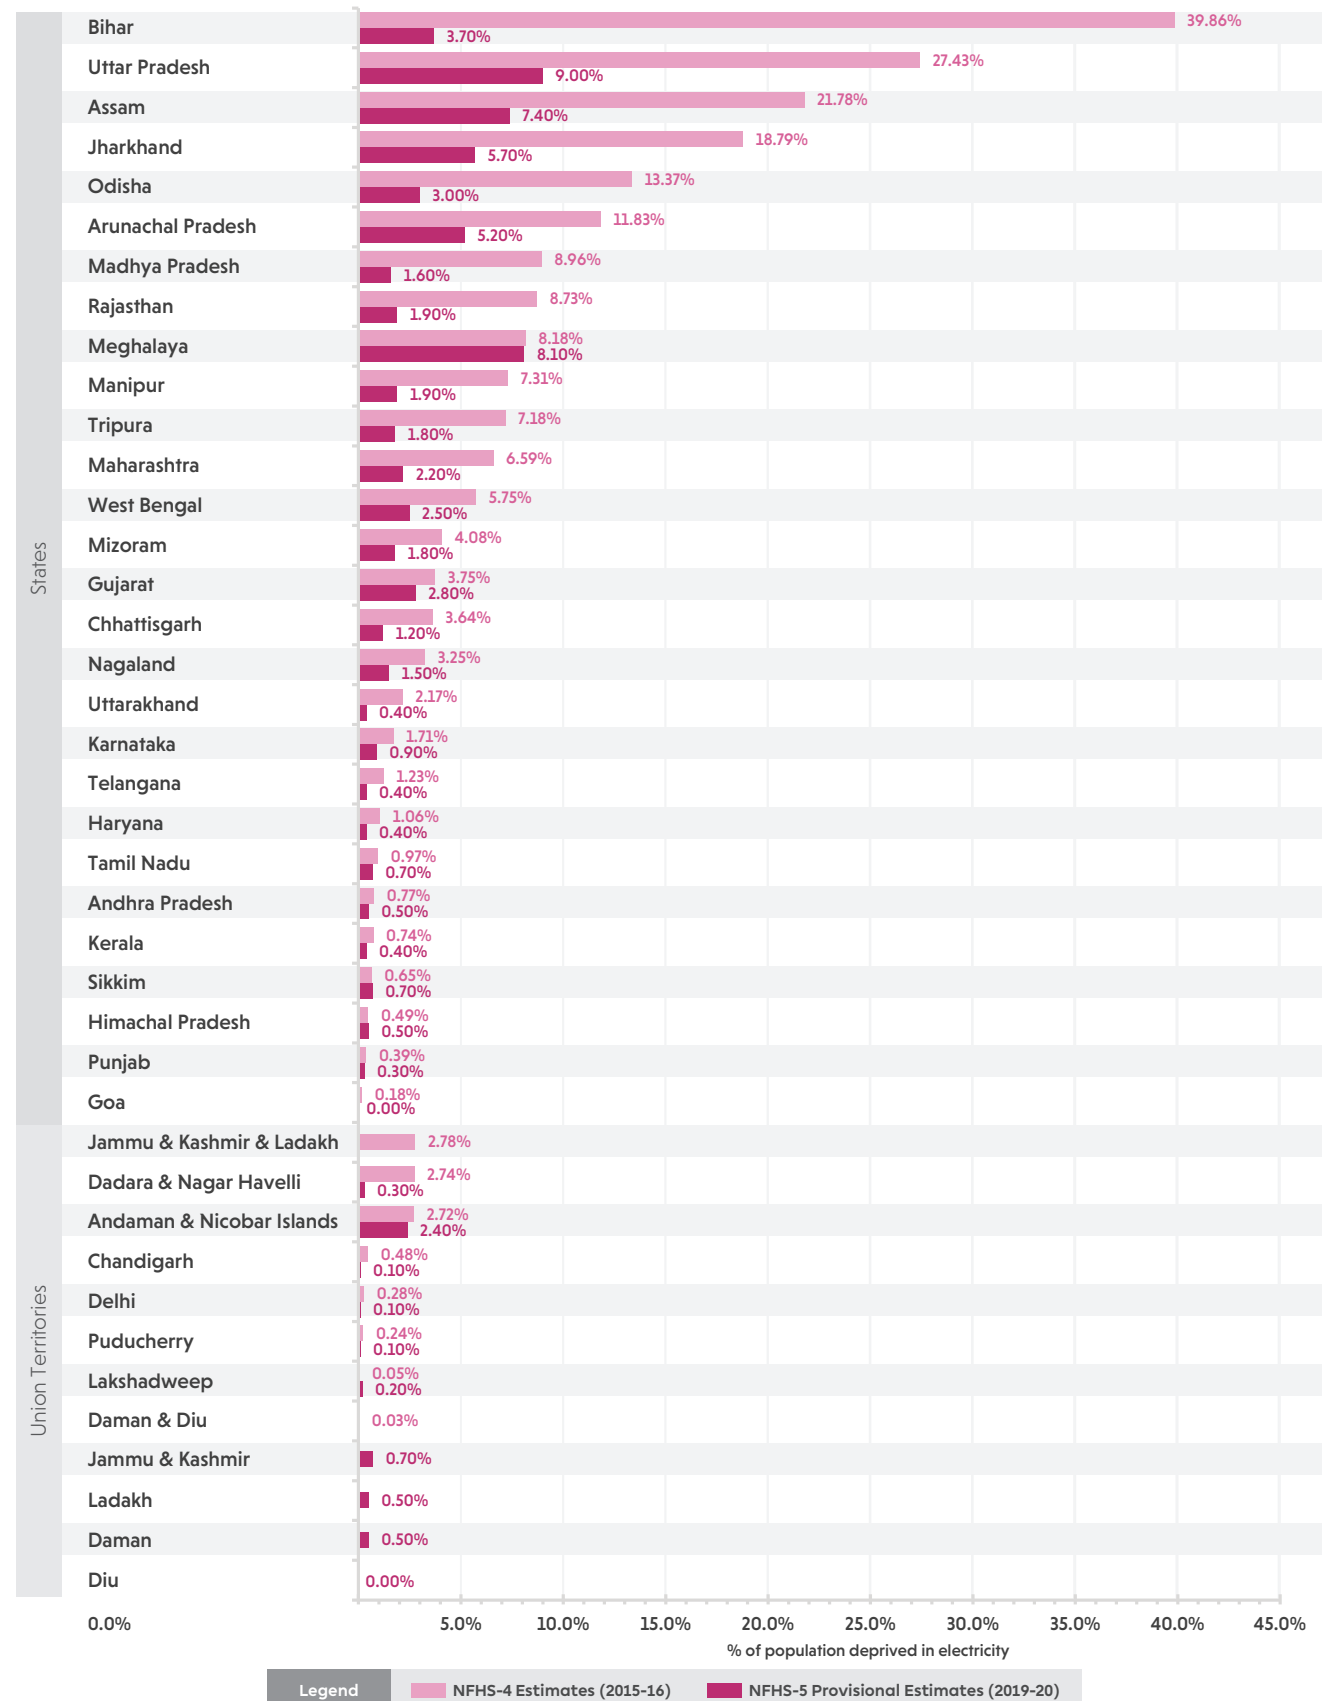

State/UT-wise percentage of population deprived

Definition: A household is deprived if it does not have access to improved drinking water or safe drinking water is more than a 30-minute walk from home (as a round trip).
Note on comparison: The NFHS-5 provisional estimates of the uncensored headcount ratio of drinking water is based on the NFHS-5 State/UT Reports. Final estimates based on the microdata may vary.

Uncensored Headcount: Electricity

State/UT-wise percentage of population deprived

Definition: A household is deprived if it has no electricity.
Note on comparison: The NFHS-5 provisional estimates of the uncensored headcount ratio of electricity is based on the NFHS-5 State/UT Reports and Factsheets. Final estimates based on the microdata may vary.

Uncensored Headcount: Housing

State/UT-wise percentage of population deprived

Definition: A household is deprived if it has inadequate housing: the floor is made of natural materials, or the roof or walls are made of rudimentary materials.
Note on comparison: The NFHS-5 provisional estimates of the uncensored headcount ratio of housing is based on the NFHS-5 State/UT Reports. Final estimates based on the microdata may vary.

Uncensored Headcount: Assets

State/UT-wise percentage of population deprived

Definition: The household is deprived if it does not own more than one of these assets: radio, TV, telephone, computer, animal cart, bicycle, motorbike, or refrigerator; and does not own a car or truck.

Uncensored Headcount: Bank Accounts

State/UT-wise percentage of population deprived

Definition: No household member has a bank account or a post office account.

Note on comparison: The NFHS-5 provisional estimates of the uncensored headcount ratio of bank accounts is based on the NFHS-5 State/UT Reports and Factsheets. Final estimates based on the microdata may vary.

Andhra Pradesh

A snapshot of multidimensional poverty in Andhra Pradesh

Overview

Andhra Pradesh Headcount Ratio, Intensity and MPI

Rural			Urban		
Headcount Ratio	Intensity	MPI	Headcount Ratio	Intensity	MPI
15.37%	43.28%	0.067	4.91%	42.83%	0.021

Andhra Pradesh: Indicator-wise Contribution to the MPI

Percentage contribution of each indicator to the MPI score

Note on the data period: The NFHS 4 (2015-16) precedes the full roll out of flagship schemes of Pradhan Mantri Awas Yojana (PMAY), Jal Jeevan Mission (JJM), Swachh Bharat Mission (SBM), Pradhan Mantri Sahaj Bijli Har Ghar Yojana (Saubhagya), Pradhan Mantri Ujjwala Yojana (PMUY), and the Pradhan Mantri Jan Dhan Yojana (PMJDY).

Andhra Pradesh: Uncensored Headcount Ratio

Percentage of total population who are deprived in each indicator

Note on comparison: The striped bars denote the provisional estimates of the uncensored headcount ratio based on the data available in the NFHS-5 Andhra Pradesh State Report (2019-20).

Andhra Pradesh: Censored Headcount Ratio

Percentage of total population who are multidimensionally poor and deprived in each indicator

Andhra Pradesh: Headcount Ratio

Percentage of population who are multidimensionally poor in each district

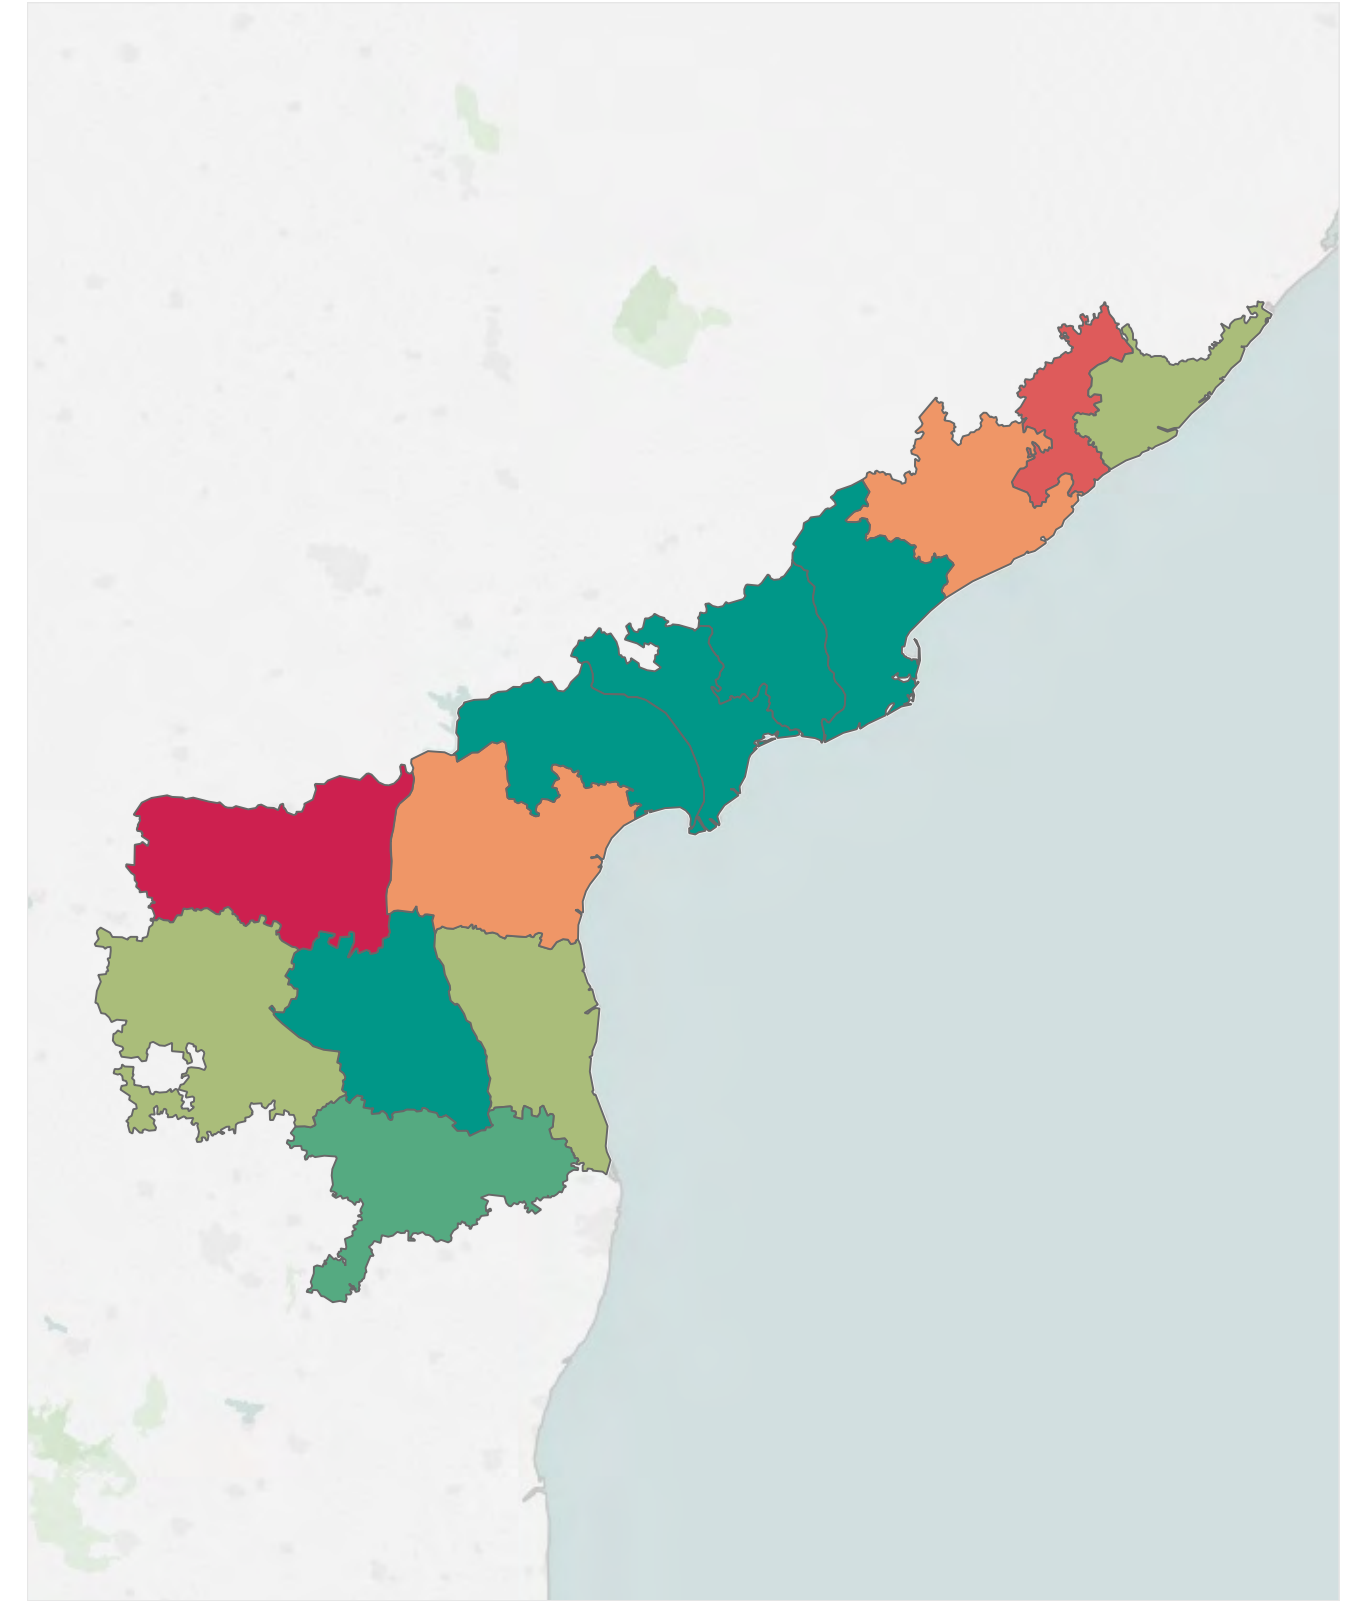

Multidimensional Poverty Index

The size of the bar represents the percentage of population who are multidimensionally poor in each district of Andhra Pradesh. The colour of the bar represents the MPI score of the district. The colour moves from green, through yellow, to red as the MPI score increases. Green represents areas with the lowest MPI scores while red represents areas with the highest MPI scores. The legend provides the range of MPI scores represented by a colour.

Andhra Pradesh

Multidimensional Poverty Index Score (District-wise)

Districts of Andhra Pradesh are as per the 2011 Census of India. The colour represents the MPI score of a district. The colour moves from green, through yellow, to red as the MPI score increases. Green represents areas with the lowest MPI scores while red represents areas with the highest MPI scores. The legend provides the range of MPI scores represented by a colour.

Multidimensional Poverty in Andhra Pradesh

District-wise Headcount Ratio, Intensity and MPI Score

Districts of Andhra Pradesh	Headcount Ratio	Intensity	MPI

Bihar

A snapshot of multidimensional poverty in Bihar

Overview

Bihar Headcount Ratio, Intensity and MPI

Rural			Urban		
Headcount Ratio	Intensity	MPI	Headcount Ratio	Intensity	MPI
56.01%	51.14%	0.286	23.91%	49%	0.117

Bihar: Indicator-wise Contribution to the MPI

Percentage contribution of each indicator to the MPI score

Note on the data period: The NFHS 4 (2015-16) precedes the full roll out of flagship schemes of Pradhan Mantri Awas Yojana (PMAY), Jal Jeevan Mission (JJM), Swachh Bharat Mission (SBM), Pradhan Mantri Sahaj Bijli Har Ghar Yojana (Saubhagya), Pradhan Mantri Ujjwala Yojana (PMUY), and the Pradhan Mantri Jan Dhan Yojana (PMJDY).

Bihar: Uncensored Headcount Ratio

Percentage of total population who are deprived in each indicator

Note on comparison: The striped bars denote the provisional estimates of the uncensored headcount ratio based on the data available in the NFHS-5 Bihar State Report (2019-20).

Bihar: Censored Headcount Ratio

Percentage of total population who are multidimensionally poor and deprived in each indicator

Bihar: Headcount Ratio

Percentage of population who are multidimensionally poor in each district

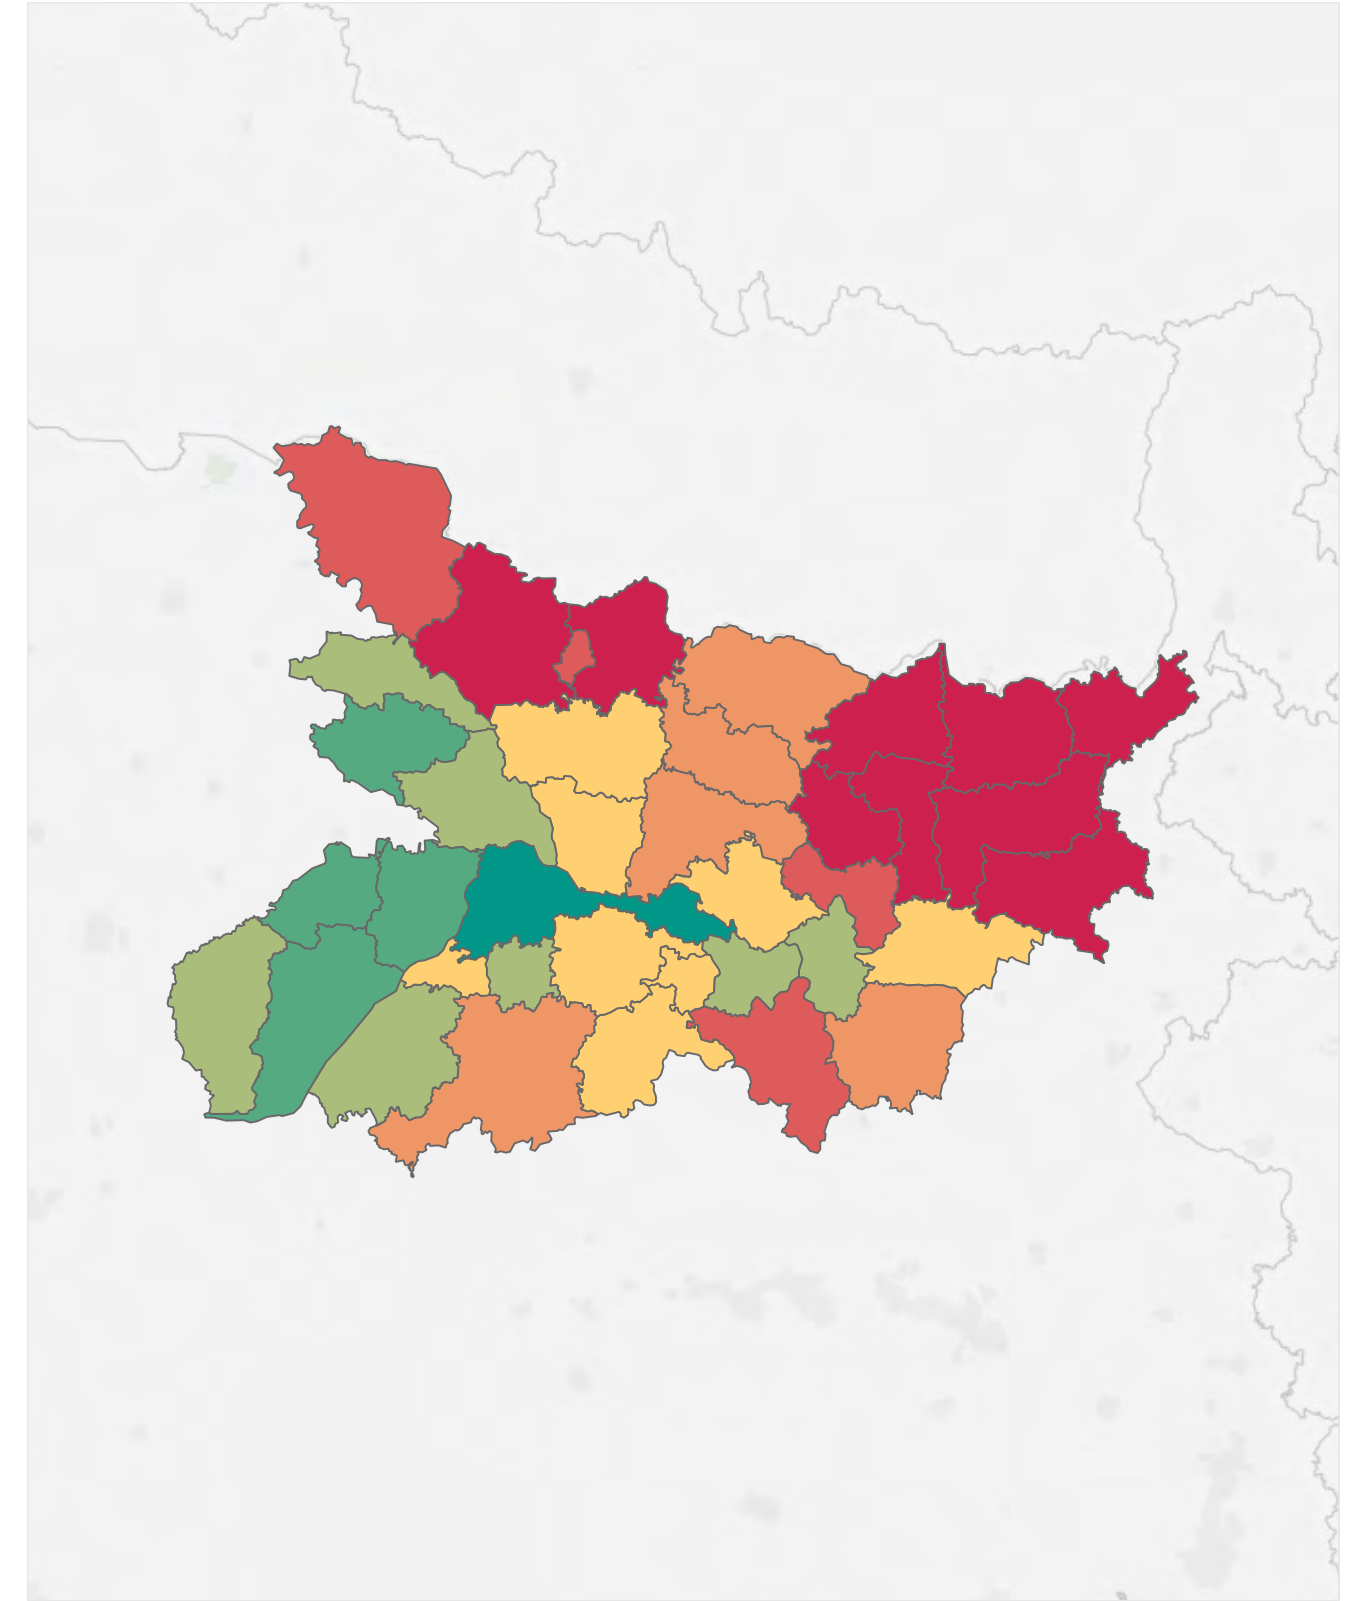

Multidimensional Poverty Index

The size of the bar represents the percentage of population who are multidimensionally poor in each district of Bihar. The colour of the bar represents the MPI score of the district. The colour moves from green, through yellow, to red as the MPI score increases. Green represents areas with the lowest MPI scores while red represents areas with the highest MPI scores. The legend provides the range of MPI scores represented by a colour.

Bihar

Multidimensional Poverty Index Score (District-wise)

Districts of Bihar are as per the 2011 Census of India. The colour represents the MPI score of a district. The colour moves from green, through yellow, to red as the MPI score increases. Green represents areas with the lowest MPI scores while red represents areas with the highest MPI scores. The legend provides the range of MPI scores represented by a colour.

Goa: Headcount Ratio

Percentage of population who are multidimensionally poor in each district

Multidimensional Poverty Index

The size of the bar represents the percentage of population who are multidimensionally poor in each district of Goa. The colour of the bar represents the MPI score of the district. The colour moves from green, through yellow, to red as the MPI score increases. Green represents areas with the lowest MPI scores while red represents areas with the highest MPI scores. The legend provides the range of MPI scores represented by a colour.

Multidimensional Poverty in Goa

District-wise Headcount Ratio, Intensity and MPI Score

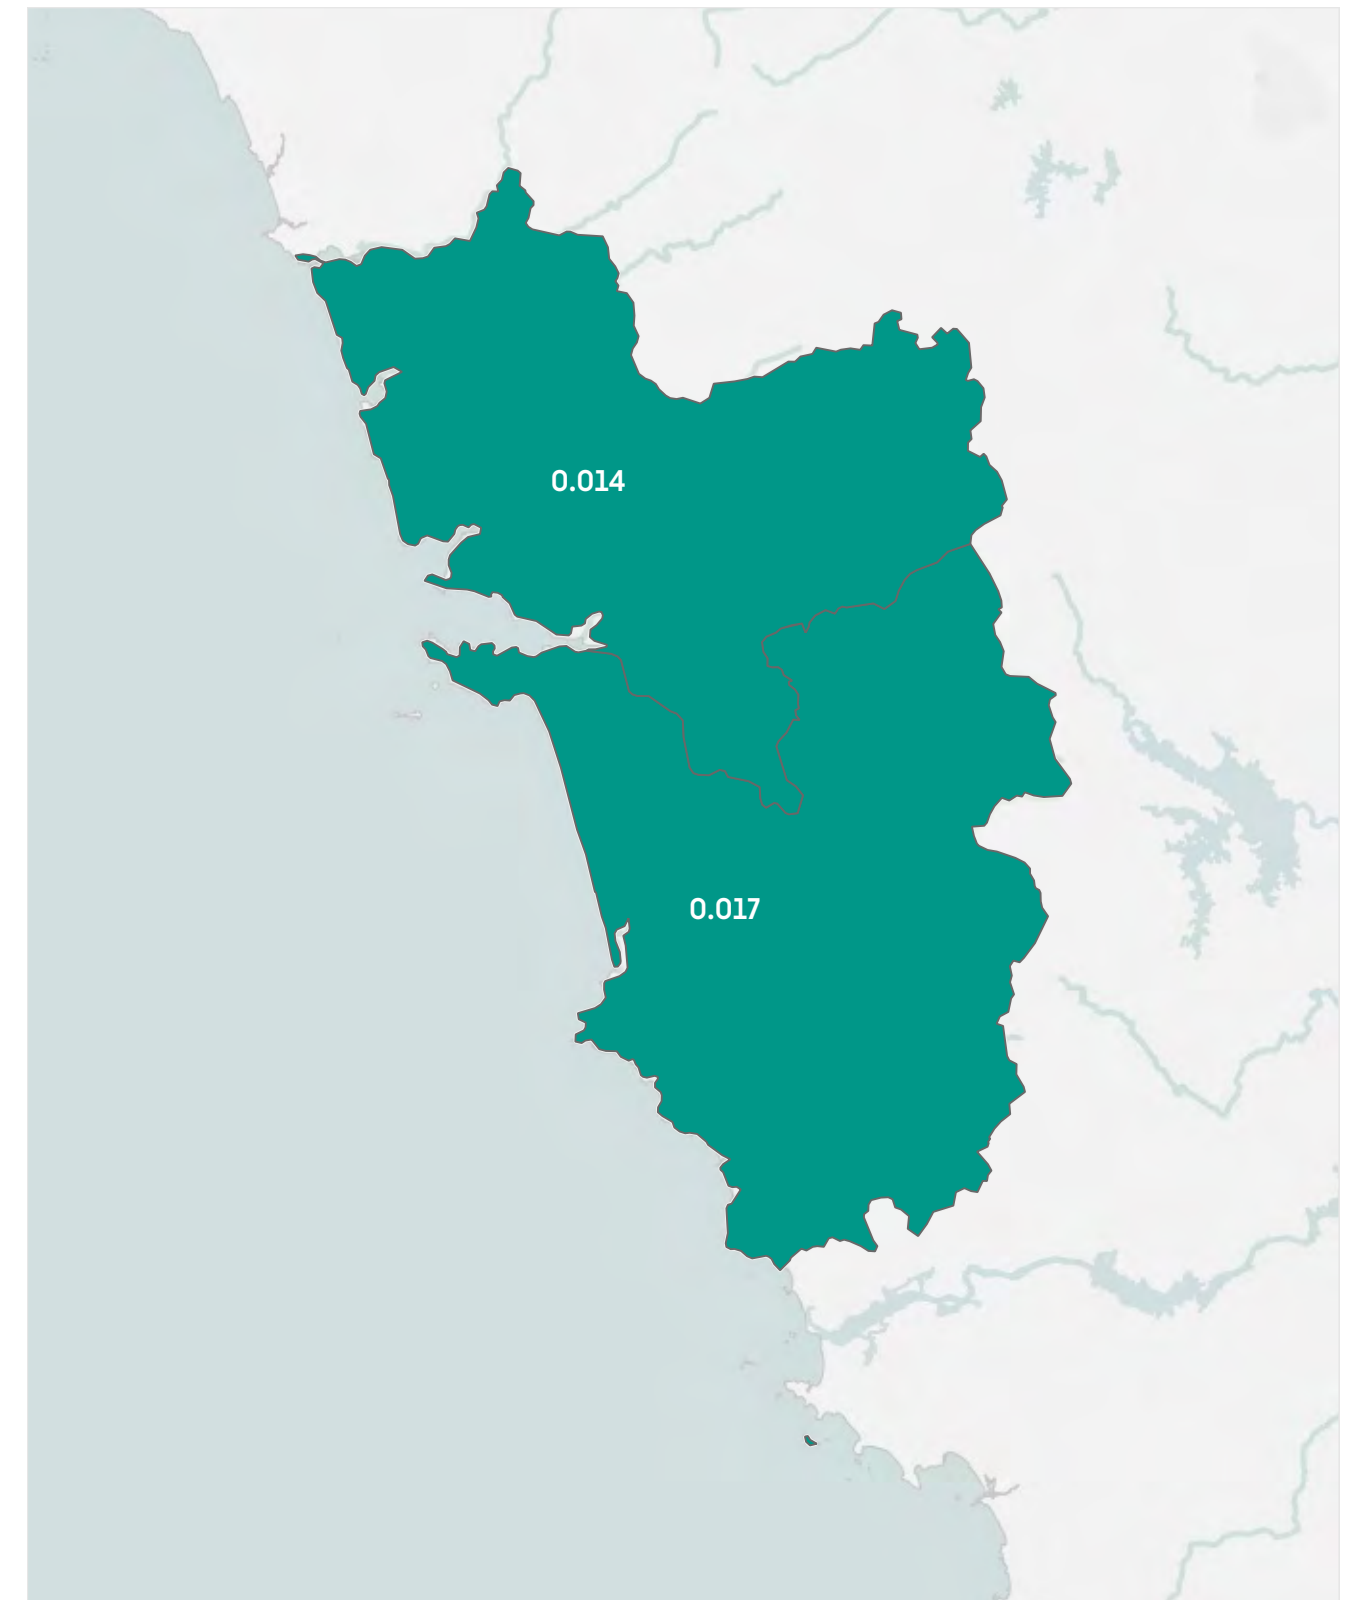

Districts of Goa	Headcount Ratio	Intensity	MPI
North Goa	3.33%	40.92%	0.014
South Goa	4.37%	39.32%	0.017

Districts of Goa	Rural			Urban		
	Headcount Ratio	Intensity	MPI	Headcount Ratio	Intensity	MPI
North Goa	4.74%	39.27%	0.019	2.45%	42.90%	0.011
South Goa	3.99%	39.34%	0.016	4.58%	39.32%	0.018

Districts of Goa are as per the 2011 Census of India

Goa

Multidimensional Poverty Index Score (District-wise)

Districts of Goa are as per the 2011 Census of India. Due to there being a relatively lower number of districts, all Union Territories and the States of Sikkim and Goa share the same colour scale. The colour represents the MPI score of a district. The colour moves from green, through yellow, to red as the MPI score increases. Green represents areas with the lowest MPI scores while red represents areas with the highest MPI scores. The legend provides the range of MPI scores represented by a colour.

Gujarat

A snapshot of multidimensional poverty in Gujarat

Overview

Gujarat Headcount Ratio, Intensity and MPI

Rural			Urban		
Headcount Ratio	Intensity	MPI	Headcount Ratio	Intensity	MPI
27.4%	45.12%	0.124	6.59%	44.34%	0.029

Gujarat: Indicator-wise Contribution to the MPI

Percentage contribution of each indicator to the MPI score

Note on the data period: The NFHS 4 (2015-16) precedes the full roll out of flagship schemes of Pradhan Mantri Awas Yojana (PMAY), Jal Jeevan Mission (JJM), Swachh Bharat Mission (SBM), Pradhan Mantri Sahaj Bijli Har Ghar Yojana (Saubhagya), Pradhan Mantri Ujjwala Yojana (PMUY), and the Pradhan Mantri Jan Dhan Yojana (PMJDY).

Gujarat: Uncensored Headcount Ratio

Haryana

A snapshot of multidimensional poverty in Haryana

Overview

Haryana Headcount Ratio, Intensity and MPI

Rural			Urban		
Headcount Ratio	Intensity	MPI	Headcount Ratio	Intensity	MPI
14.86%	44.38%	0.066	8.16%	44.48%	0.036

Haryana: Indicator-wise Contribution to the MPI

Percentage contribution of each indicator to the MPI score

Note on the data period: The NFHS 4 (2015-16) precedes the full roll out of flagship schemes of Pradhan Mantri Awas Yojana (PMAY), Jal Jeevan Mission (JJM), Swachh Bharat Mission (SBM), Pradhan Mantri Sahaj Bijli Har Ghar Yojana (Saubhagya), Pradhan Mantri Ujjwala Yojana (PMUY), and the Pradhan Mantri Jan Dhan Yojana (PMJDY).

Haryana: Uncensored Headcount Ratio

Percentage of total population who are deprived in each indicator

Note on comparison: The striped bars denote the provisional estimates of the uncensored headcount ratio based on the data available in the NFHS-5 Haryana State Factsheet (2019-20).

Haryana: Censored Headcount Ratio

Percentage of total population who are multidimensionally poor and deprived in each indicator

Haryana: Headcount Ratio

Percentage of population who are multidimensionally poor in each district

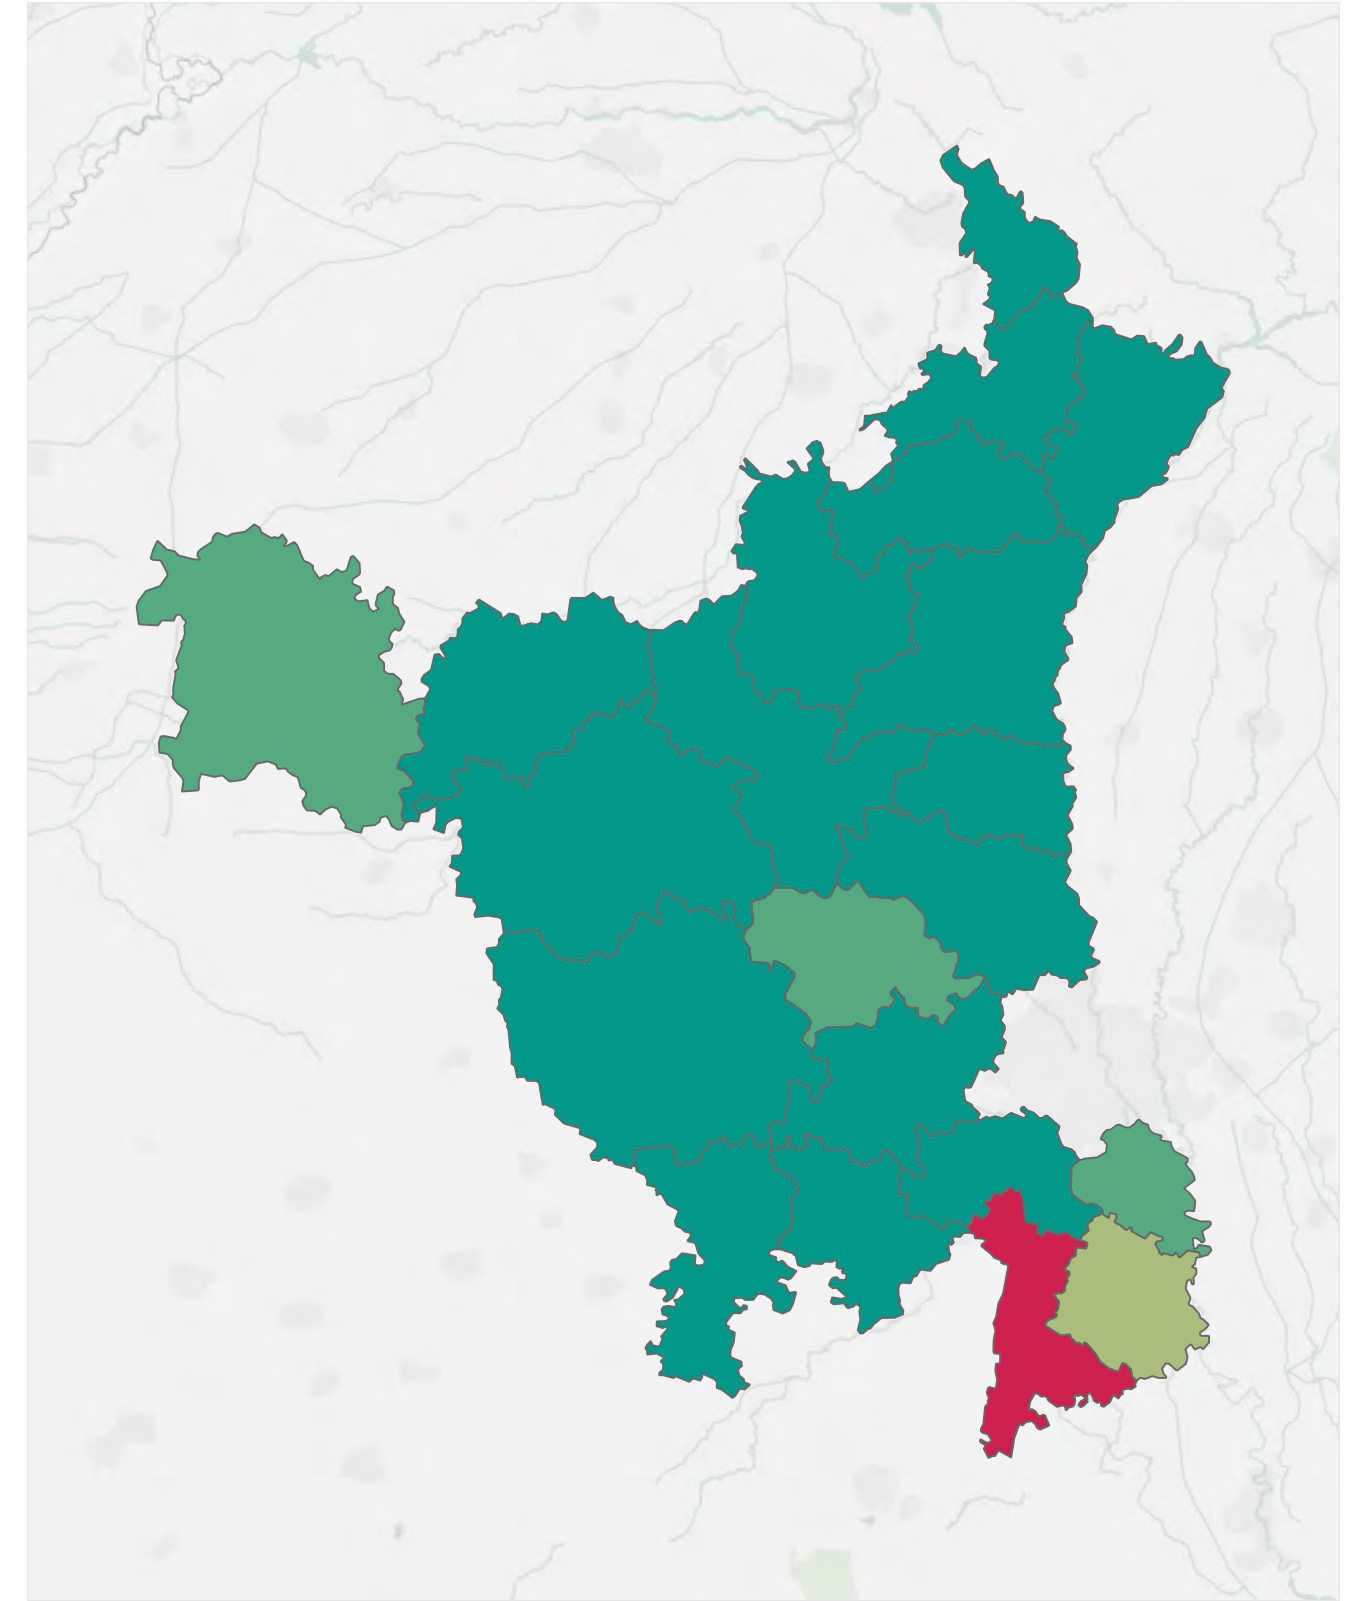

Multidimensional Poverty Index

The size of the bar represents the percentage of population who are multidimensionally poor in each district of Haryana. The colour of the bar represents the MPI score of the district. The colour moves from green, through yellow, to red as the MPI score increases. Green represents areas with the lowest MPI scores while red represents areas with the highest MPI scores. The legend provides the range of MPI scores represented by a colour.

Haryana

Multidimensional Poverty Index Score (District-wise)

Districts of Haryana are as per the 2011 Census of India. The colour represents the MPI score of a district. The colour moves from green, through yellow, to red as the MPI score increases. Green represents areas with the lowest MPI scores while red represents areas with the highest MPI scores. The legend provides the range of MPI scores represented by a colour.

Kerala

A snapshot of multidimensional poverty in Kerala

Overview

Kerala Headcount Ratio, Intensity and MPI

Rural			Urban		
Headcount Ratio	Intensity	MPI	Headcount Ratio	Intensity	MPI
0.95%	39.81%	0.004	0.43%	37.06%	0.002

Kerala: Indicator-wise Contribution to the MPI

Percentage contribution of each indicator to the MPI score

Note on the data period: The NFHS 4 (2015-16) precedes the full roll out of flagship schemes of Pradhan Mantri Awas Yojana (PMAY), Jal Jeevan Mission (JJM), Swachh Bharat Mission (SBM), Pradhan Mantri Sahaj Bijli Har Ghar Yojana (Saubhagya), Pradhan Mantri Ujjwala Yojana (PMUY), and the Pradhan Mantri Jan Dhan Yojana (PMJDY).

Kerala: Uncensored Headcount Ratio

Percentage of total population who are deprived in each indicator

Note on comparison: The striped bars denote the provisional estimates of the uncensored headcount ratio based on the data available in the NFHS-5 Kerala State Report (2019-20).

Kerala: Censored Headcount Ratio

Percentage of total population who are multidimensionally poor and deprived in each indicator

Kerala: Headcount Ratio

Percentage of population who are multidimensionally poor in each district

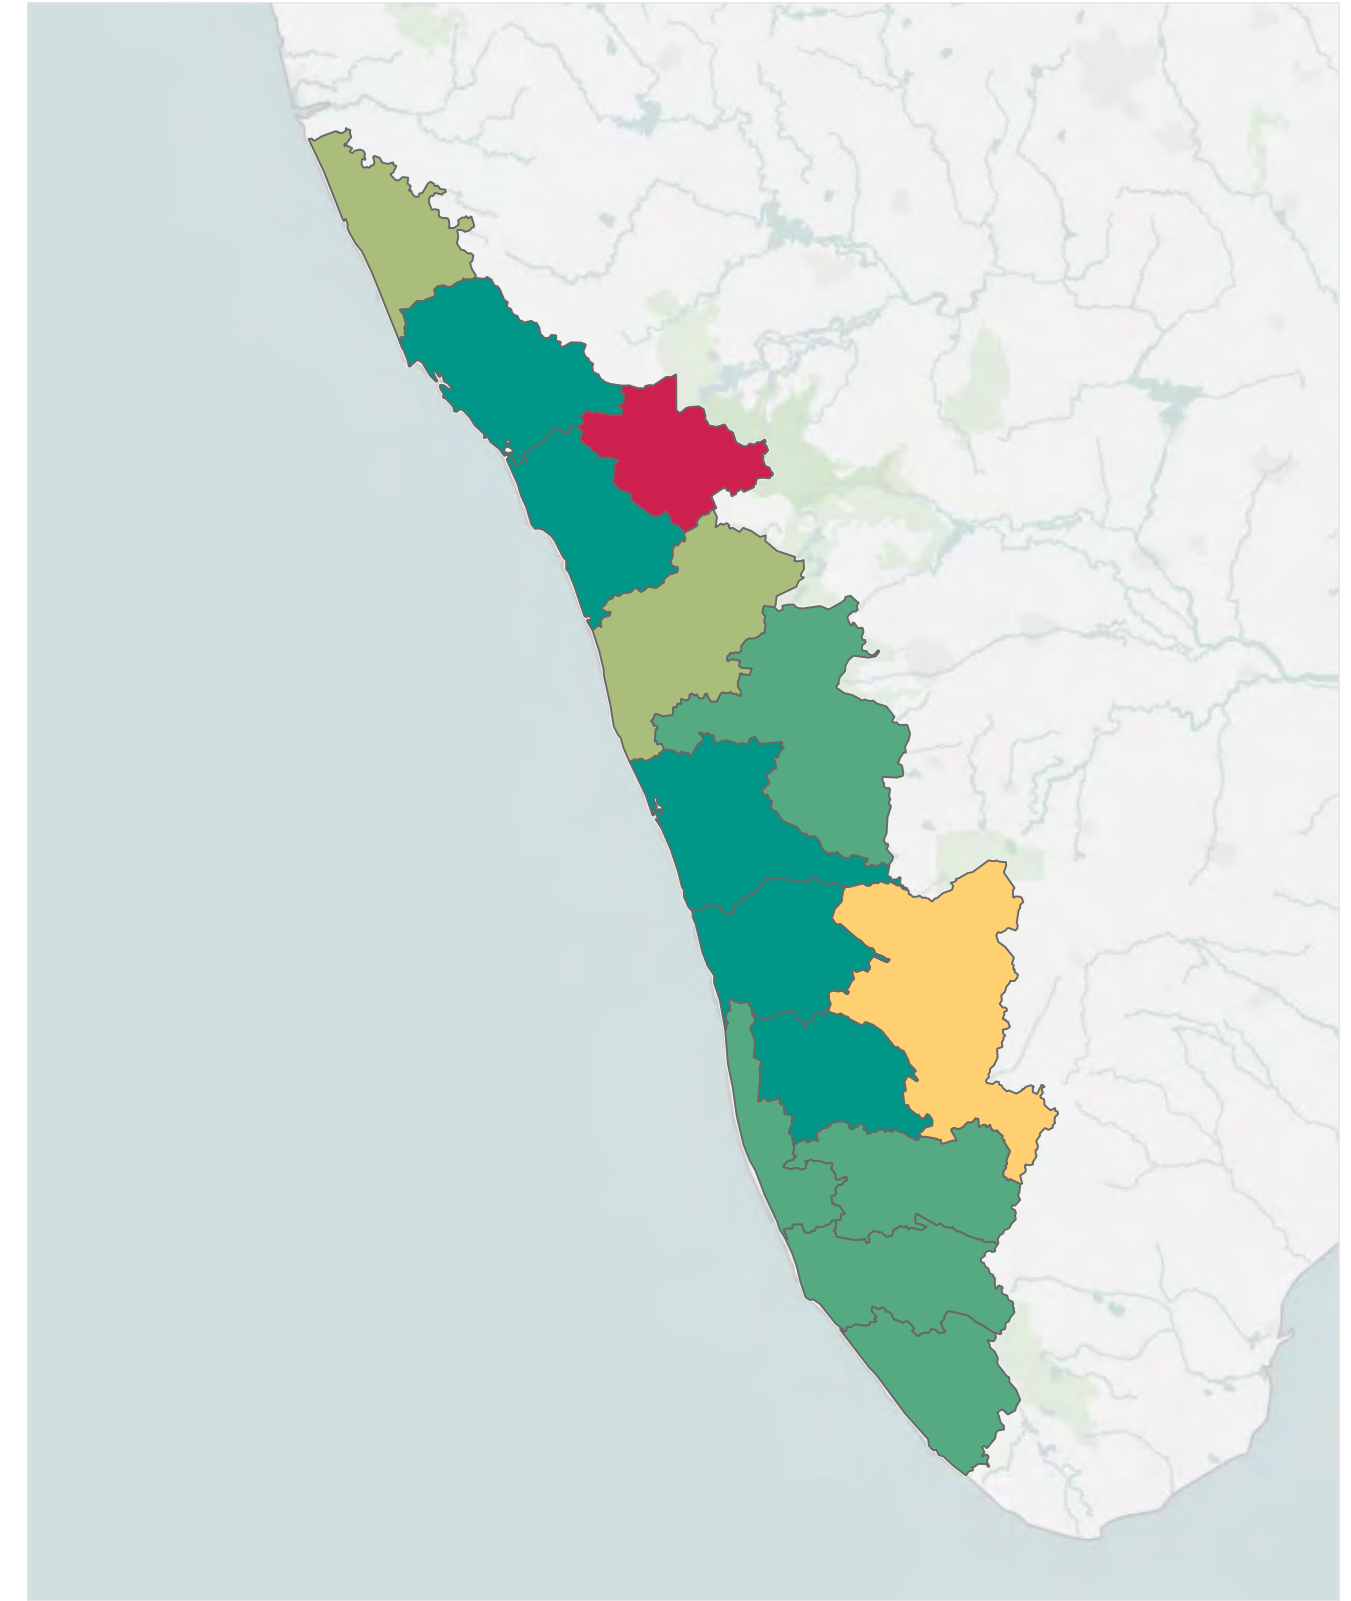

Multidimensional Poverty Index

The size of the bar represents the percentage of population who are multidimensionally poor in each district of Kerala. The colour of the bar represents the MPI score of the district. The colour moves from green, through yellow, to red as the MPI score increases. Green represents areas with the lowest MPI scores while red represents areas with the highest MPI scores. The legend provides the range of MPI scores represented by a colour.

Kerala

Multidimensional Poverty Index Score (District-wise)

Districts of Kerala are as per the 2011 Census of India. The colour represents the MPI score of a district. The colour moves from green, through yellow, to red as the MPI score increases. Green represents areas with the lowest MPI scores while red represents areas with the highest MPI scores. The legend provides the range of MPI scores represented by a colour.

Manipur

A snapshot of multidimensional poverty in Manipur

Overview

Manipur Headcount Ratio, Intensity and MPI

Rural			Urban		
Headcount Ratio	Intensity	MPI	Headcount Ratio	Intensity	MPI
22.95%	45.07%	0.103	9.9%	42.17%	0.042

Manipur: Indicator-wise Contribution to the MPI

Percentage contribution of each indicator to the MPI score

Note on the data period: The NFHS 4 (2015-16) precedes the full roll out of flagship schemes of Pradhan Mantri Awas Yojana (PMAY), Jal Jeevan Mission (JJM), Swachh Bharat Mission (SBM), Pradhan Mantri Sahaj Bijli Har Ghar Yojana (Saubhagya), Pradhan Mantri Ujjwala Yojana (PMUY), and the Pradhan Mantri Jan Dhan Yojana (PMJDY).

Manipur: Uncensored Headcount Ratio

Percentage of total population who are deprived in each indicator

Note on comparison: The striped bars denote the provisional estimates of the uncensored headcount ratio based on the data available in the NFHS-5 Manipur State Report (2019-20).

Manipur: Censored Headcount Ratio

Percentage of total population who are multidimensionally poor and deprived in each indicator

Manipur: Headcount Ratio

Percentage of population who are multidimensionally poor in each district

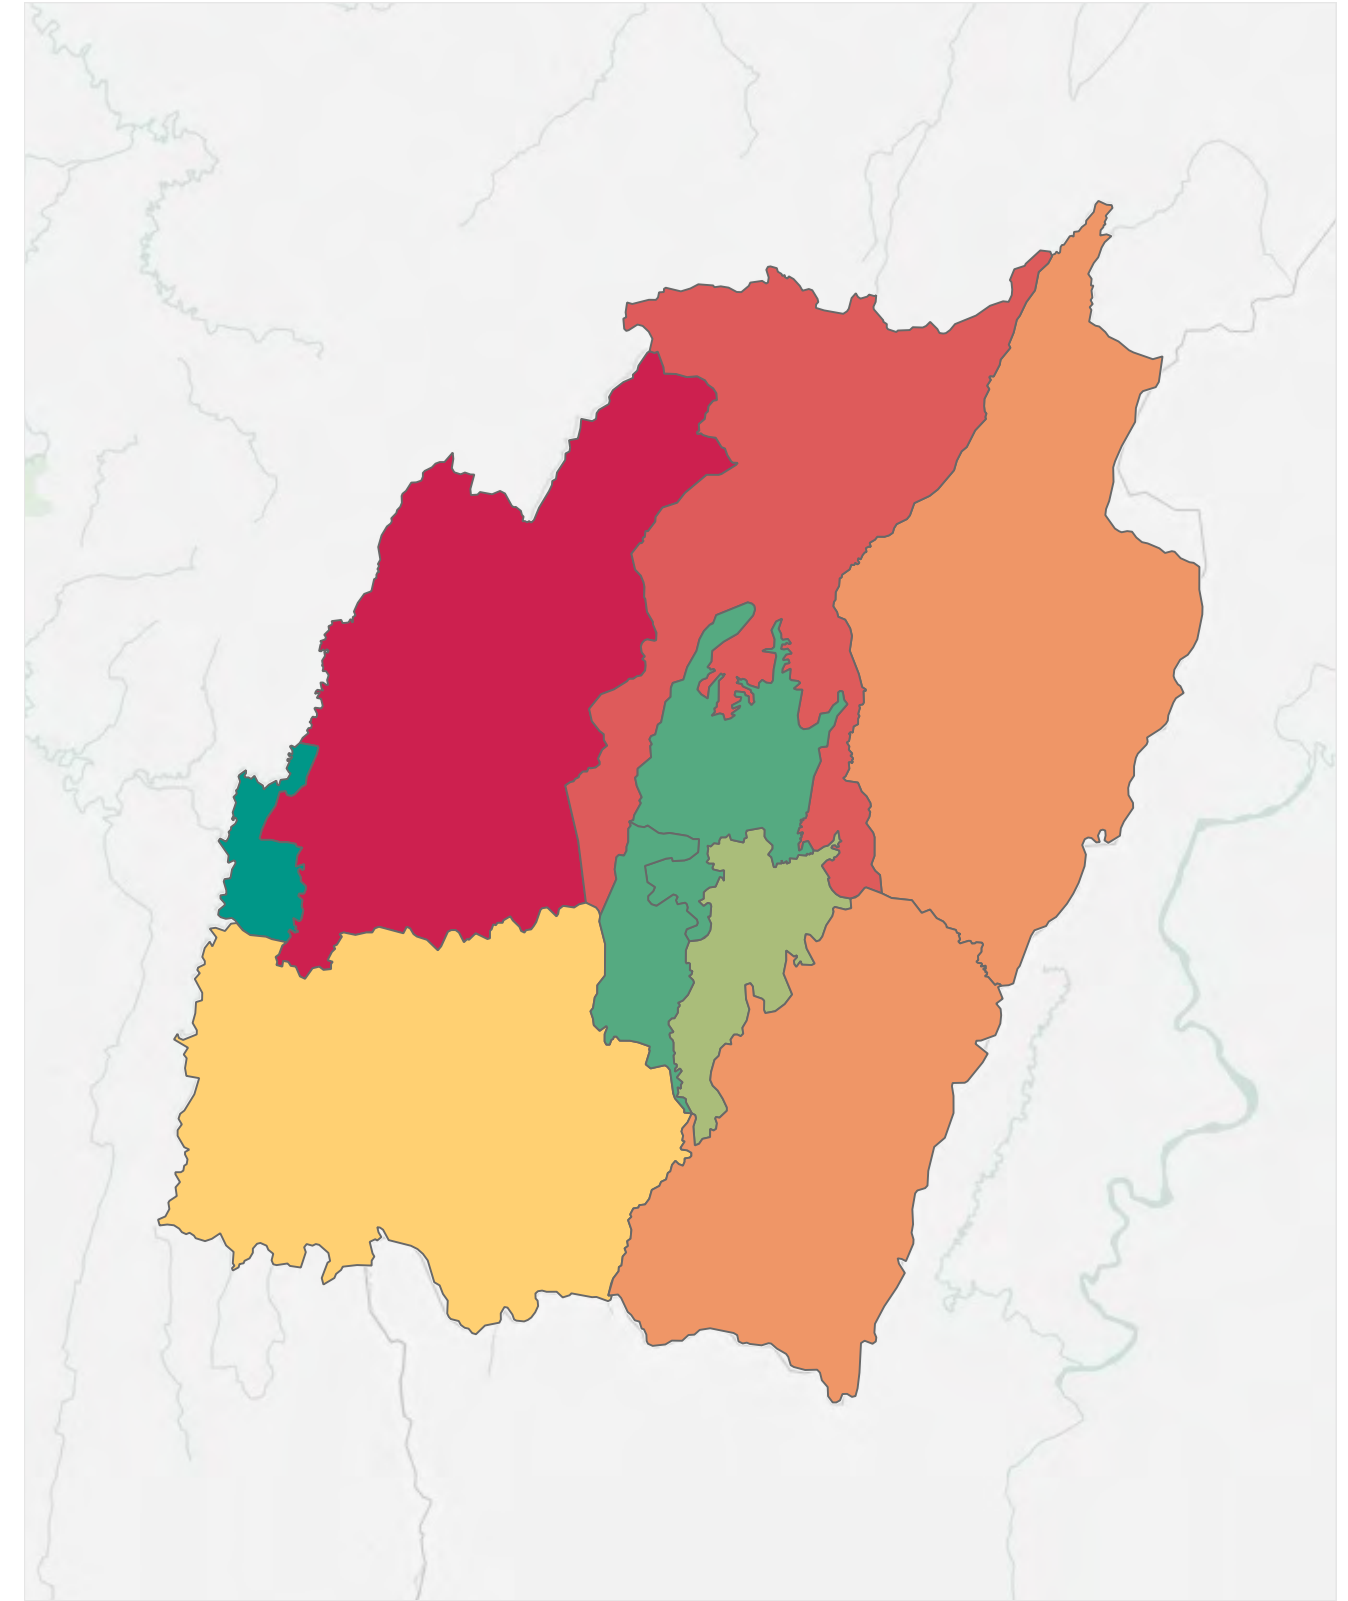

Multidimensional Poverty Index

0.034 to 0.054 0.055 to 0.075 0.076 to 0.096 0.097 to 0.116 0.117 to 0.137 0.138 to 0.158 0.159 to 0.180

The size of the bar represents the percentage of population who are multidimensionally poor in each district of Manipur. The colour of the bar represents the MPI score of the district. The colour moves from green, through yellow, to red as the MPI score increases. Green represents areas with the lowest MPI scores while red represents areas with the highest MPI scores. The legend provides the range of MPI scores represented by a colour.

Manipur

Multidimensional Poverty Index Score (District-wise)

0.034 to 0.054 0.055 to 0.075 0.076 to 0.096 0.097 to 0.116 0.117 to 0.137 0.138 to 0.158 0.159 to 0.180

Districts of Manipur are as per the 2011 Census of India. The colour represents the MPI score of a district. The colour moves from green, through yellow, to red as the MPI score increases. Green represents areas with the lowest MPI scores while red represents areas with the highest MPI scores. The legend provides the range of MPI scores represented by a colour.

Punjab

A snapshot of multidimensional poverty in Punjab

Overview

Punjab Headcount Ratio, Intensity and MPI

Rural			Urban		
Headcount Ratio	Intensity	MPI	Headcount Ratio	Intensity	MPI
6.4%	43.2%	0.028	4.32%	45.02%	0.019

Punjab: Indicator-wise Contribution to the MPI

Percentage contribution of each indicator to the MPI score

Note on the data period: The NFHS 4 (2015-16) precedes the full roll out of flagship schemes of Pradhan Mantri Awas Yojana (PMAY), Jal Jeevan Mission (JJM), Swachh Bharat Mission (SBM), Pradhan Mantri Sahaj Bijli Har Ghar Yojana (Saubhagya), Pradhan Mantri Ujjwala Yojana (PMUY), and the Pradhan Mantri Jan Dhan Yojana (PMJDY).

Punjab: Uncensored Headcount Ratio

Percentage of total population who are deprived in each indicator

Note on comparison: The striped bars denote the provisional estimates of the uncensored headcount ratio based on the data available in the NFHS-5 Punjab State Factsheet (2019-20).

Punjab: Censored Headcount Ratio

Percentage of total population who are multidimensionally poor and deprived in each indicator

Punjab: Headcount Ratio

Percentage of population who are multidimensionally poor in each district

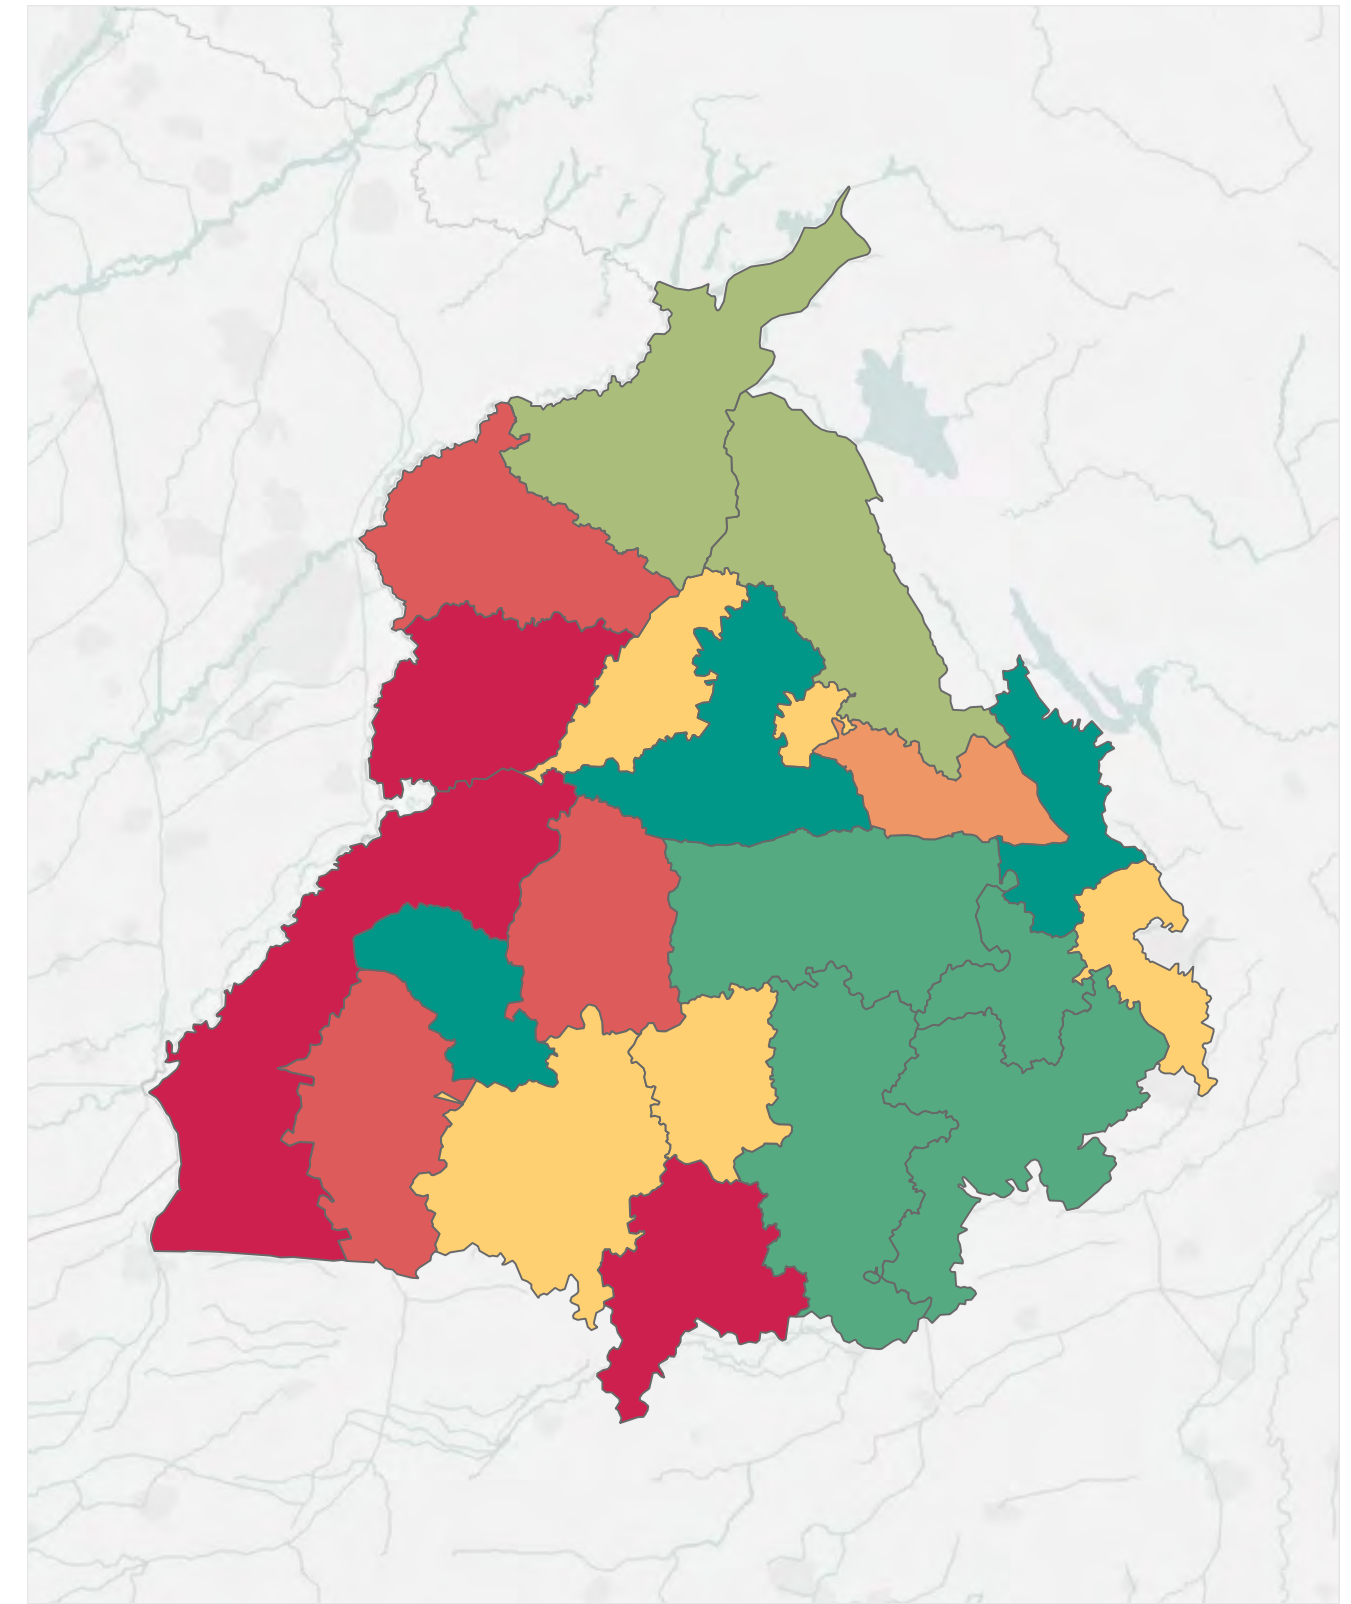

Multidimensional Poverty Index

The size of the bar represents the percentage of population who are multidimensionally poor in each district of Punjab. The colour of the bar represents the MPI score of the district. The colour moves from green, through yellow, to red as the MPI score increases. Green represents areas with the lowest MPI scores while red represents areas with the highest MPI scores. The legend provides the range of MPI scores represented by a colour.

Punjab

Multidimensional Poverty Index Score (District-wise)

Districts of Punjab are as per the 2011 Census of India. The colour represents the MPI score of a district. The colour moves from green, through yellow, to red as the MPI score increases. Green represents areas with the lowest MPI scores while red represents areas with the highest MPI scores. The legend provides the range of MPI scores represented by a colour.

West Sikkim	4.78%	42.38%	0.020	1.85%	42.86%	0.008

Districts of Sikkim are as per the 2011 Census of India

Sikkim

Multidimensional Poverty Index Score (District-wise)

Districts of Sikkim are as per the 2011 Census of India. Due to there being a relatively lower number of districts, all Union Territories and the States of Sikkim and Goa share the same colour scale. The colour represents the MPI score of a district. The colour moves from green, through yellow, to red as the MPI score increases. Green represents areas with the lowest MPI scores while red represents areas with the highest MPI scores. The legend provides the range of MPI scores represented by a colour.

Tamil Nadu

A snapshot of multidimensional poverty in Tamil Nadu

Overview

Tamil Nadu Headcount Ratio, Intensity and MPI

Rural			Urban

Telangana

A snapshot of multidimensional poverty in Telangana

Overview

Telangana Headcount Ratio, Intensity and MPI

Rural			Urban		
Headcount Ratio	Intensity	MPI	Headcount Ratio	Intensity	MPI
20.35%	43.23%	0.088	5.1%	43.01%	0.022

Telangana: Indicator-wise Contribution to the MPI

Percentage contribution of each indicator to the MPI score

Note on the data period: The NFHS 4 (2015-16) precedes the full roll out of flagship schemes of Pradhan Mantri Awas Yojana (PMAY), Jal Jeevan Mission (JJM), Swachh Bharat Mission (SBM), Pradhan Mantri Sahaj Bijli Har Ghar Yojana (Saubhagya), Pradhan Mantri Ujjwala Yojana (PMUY), and the Pradhan Mantri Jan Dhan Yojana (PMJDY).

Telangana: Uncensored Headcount Ratio

Percentage of total population who are deprived in each indicator

Note on comparison: The striped bars denote the provisional estimates of the uncensored headcount ratio based on the data available in the NFHS-5 Telangana State Report (2019-20).

Telangana: Censored Headcount Ratio

Percentage of total population who are multidimensionally poor and deprived in each indicator

Telangana: Headcount Ratio

Percentage of population who are multidimensionally poor in each district

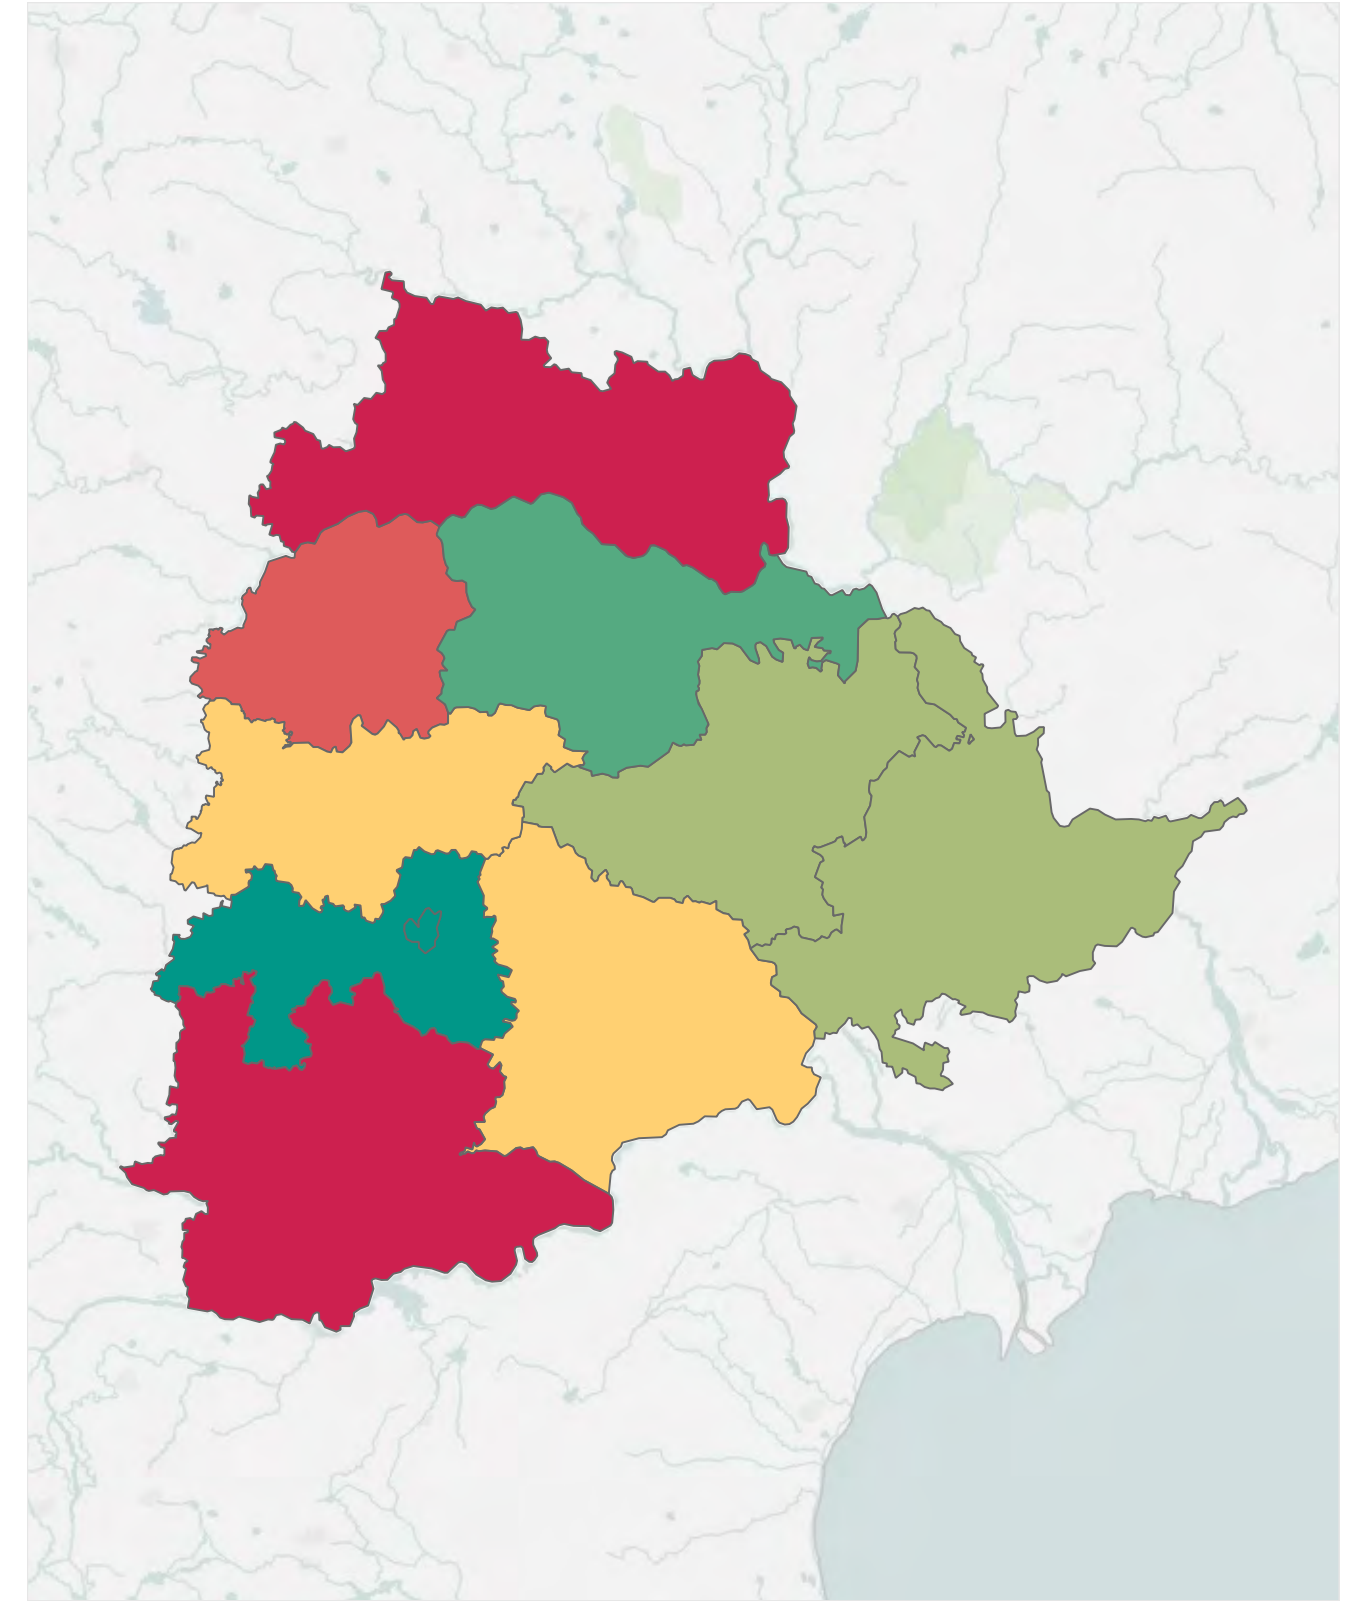

Multidimensional Poverty Index

The size of the bar represents the percentage of population who are multidimensionally poor in each district of Telangana. The colour of the bar represents the MPI score of the district. The colour moves from green, through yellow, to red as the MPI score increases. Green represents areas with the lowest MPI scores while red represents areas with the highest MPI scores. The legend provides the range of MPI scores represented by a colour.

Telangana

Multidimensional Poverty Index Score (District-wise)

Districts of Telangana are as per the 2011 Census of India (erstwhile Andhra Pradesh). The colour represents the MPI score of a district. The colour moves from green, through yellow, to red as the MPI score increases. Green represents areas with the lowest MPI scores while red represents areas with the highest MPI scores. The legend provides the range of MPI scores represented by a colour.

Multidimensional Poverty in Telangana

District-wise Headcount Ratio, Intensity and MPI Score

Districts of Telangana	Headcount Ratio	Intensity	MPI
Adilabad	27.43%	46.03%	0.126

Tripura

Multidimensional Poverty Index Score (District-wise)

Districts of Tripura are as per the 2011 Census of India. The colour represents the MPI score of a district. The colour moves from green, through yellow, to red as the MPI score increases. Green represents areas with the lowest MPI scores while red represents areas with the highest MPI scores. The legend provides the range of MPI scores represented by a colour.

Uttar Pradesh

A snapshot of multidimensional poverty in Uttar Pradesh

Overview

Uttar Pradesh Headcount Ratio, Intensity and MPI

Rural			Urban		
Headcount Ratio	Intensity	MPI	Headcount Ratio	Intensity	MPI
44.32%	47.67%	0.211	18.07%	47.06%	0.085

Uttar Pradesh: Indicator-wise Contribution to the MPI

Percentage contribution of each indicator to the MPI score

Note on the data period: The NFHS 4 (2015-16) precedes the full roll out of flagship schemes of Pradhan Mantri Awas Yojana (PMAY), Jal Jeevan Mission (JJM), Swachh Bharat Mission (SBM), Pradhan Mantri Sahaj Bijli Har Ghar Yojana (Saubhagya), Pradhan Mantri Ujjwala Yojana (PMUY), and the Pradhan Mantri Jan Dhan Yojana (PMJDY).

Uttar Pradesh: Uncensored Headcount Ratio

Percentage of total population who are deprived in each indicator

Note on comparison: The striped bars denote the provisional estimates of the uncensored headcount ratio based on the data available in the NFHS-5 Uttar Pradesh State Factsheet (2019-20).

Uttar Pradesh: Censored Headcount Ratio

Percentage of total population who are multidimensionally poor and deprived in each indicator

Uttar Pradesh: Headcount Ratio

Percentage of population who are multidimensionally poor in each district

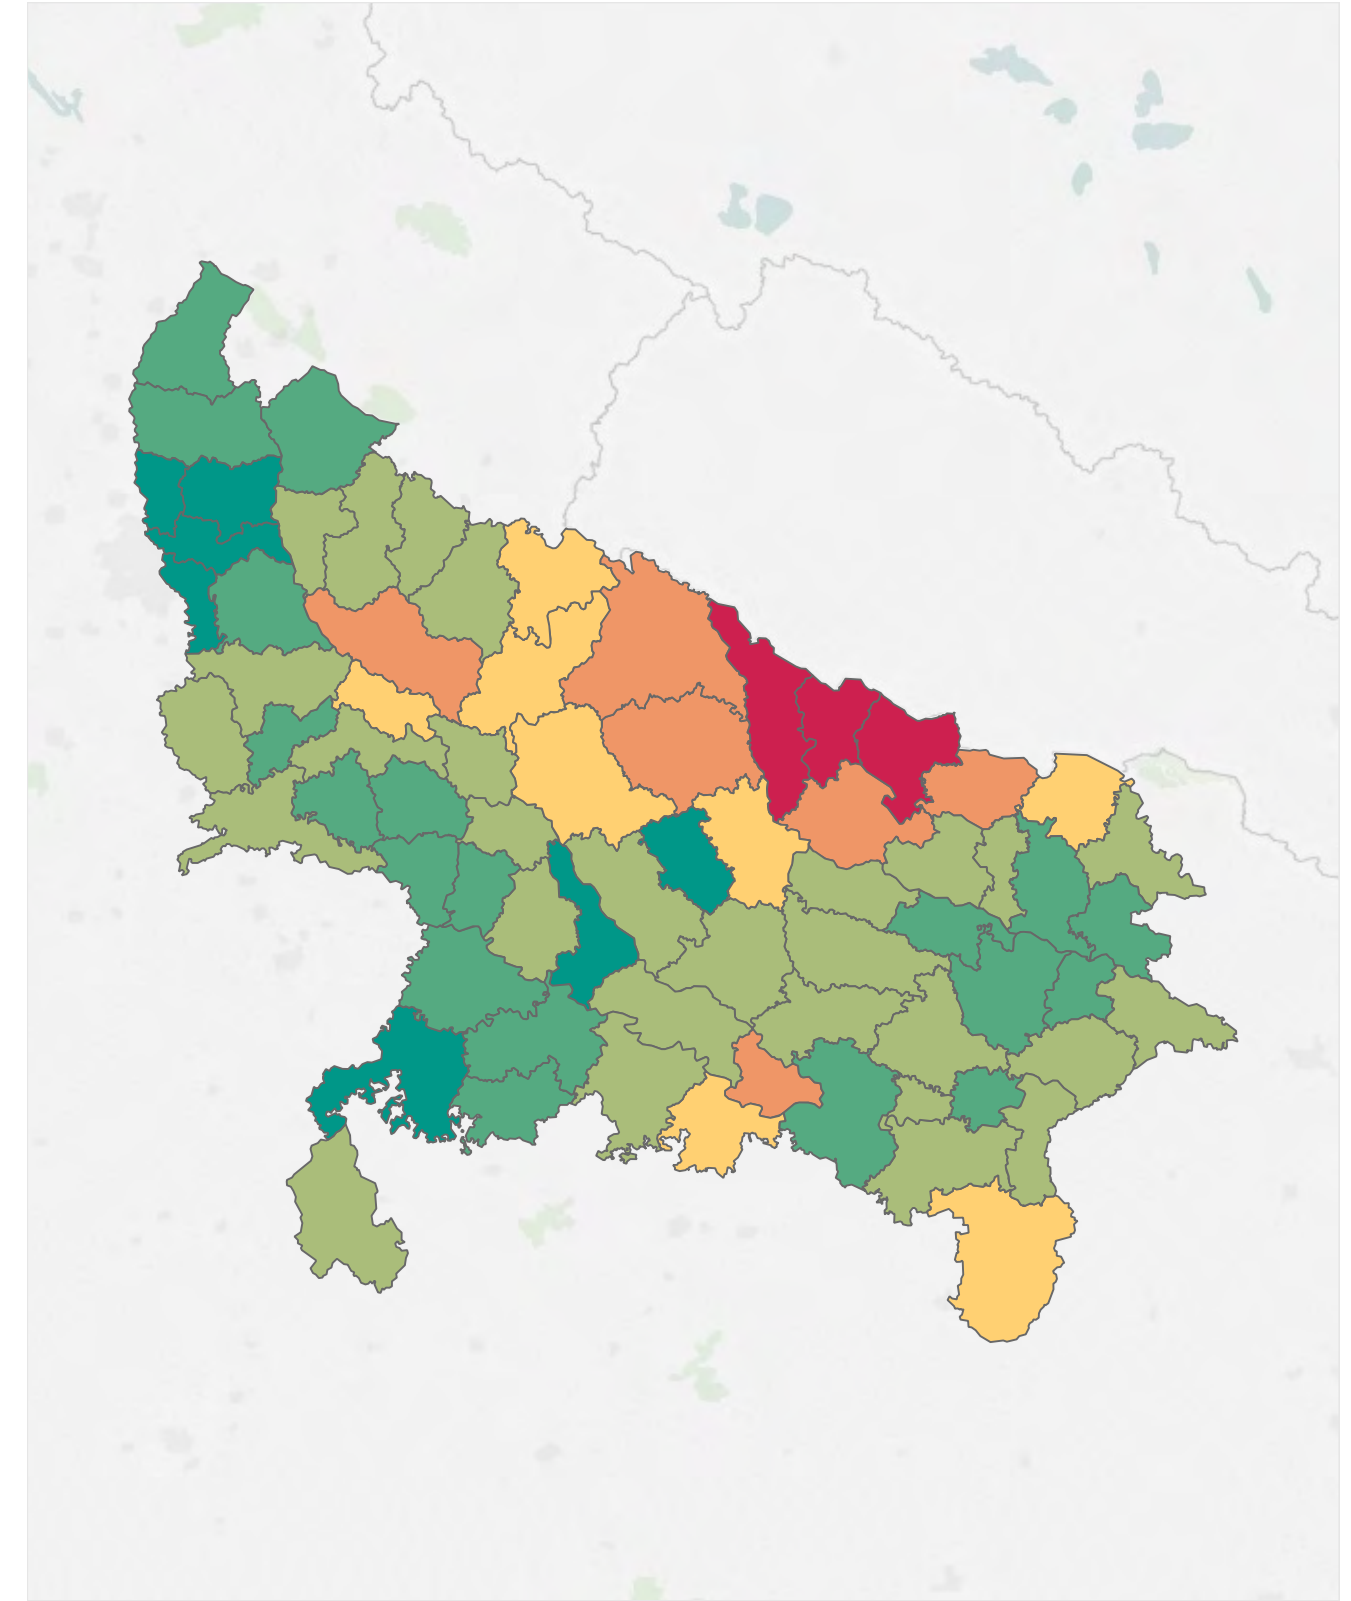

Multidimensional Poverty Index

The size of the bar represents the percentage of population who are multidimensionally poor in each district of Uttar Pradesh. The colour of the bar represents the MPI score of the district. The colour moves from green, through yellow, to red as the MPI score increases. Green represents areas with the lowest MPI scores while red represents areas with the highest MPI scores. The legend provides the range of MPI scores represented by a colour.

Uttar Pradesh

Multidimensional Poverty Index Score (District-wise)

Districts of Uttar Pradesh are as per the 2011 Census of India. The colour represents the MPI score of a district. The colour moves from green, through yellow, to red as the MPI score increases. Green represents areas with the lowest MPI scores while red represents areas with the highest MPI scores. The legend provides the range of MPI scores represented by a colour.

Uttarakhand

A snapshot of multidimensional poverty in Uttarakhand

Overview

Uttarakhand Headcount Ratio, Intensity and MPI

Rural			Urban		
Headcount Ratio	Intensity	MPI	Headcount Ratio	Intensity	MPI
21.94%	43.78%	0.096	9.89%	46.82%	0.046

Uttarakhand: Indicator-wise Contribution to the MPI

Percentage contribution of each indicator to the MPI score

Note on the data period: The NFHS 4 (2015-16) precedes the full roll out of flagship schemes of Pradhan Mantri Awas Yojana (PMAY), Jal Jeevan Mission (JJM), Swachh Bharat Mission (SBM), Pradhan Mantri Sahaj Bijli Har Ghar Yojana (Saubhagya), Pradhan Mantri Ujjwala Yojana (PMUY), and the Pradhan Mantri Jan Dhan Yojana (PMJDY).

Uttarakhand: Uncensored Headcount Ratio

Percentage of total population who are deprived in each indicator

Note on comparison: The striped bars denote the provisional estimates of the uncensored headcount ratio based on the data available in the NFHS-5 Uttarakhand State Factsheet (2019-20).

Uttarakhand: Censored Headcount Ratio

Percentage of total population who are multidimensionally poor and deprived in each indicator

Uttarakhand: Headcount Ratio

Percentage of population who are multidimensionally poor in each district

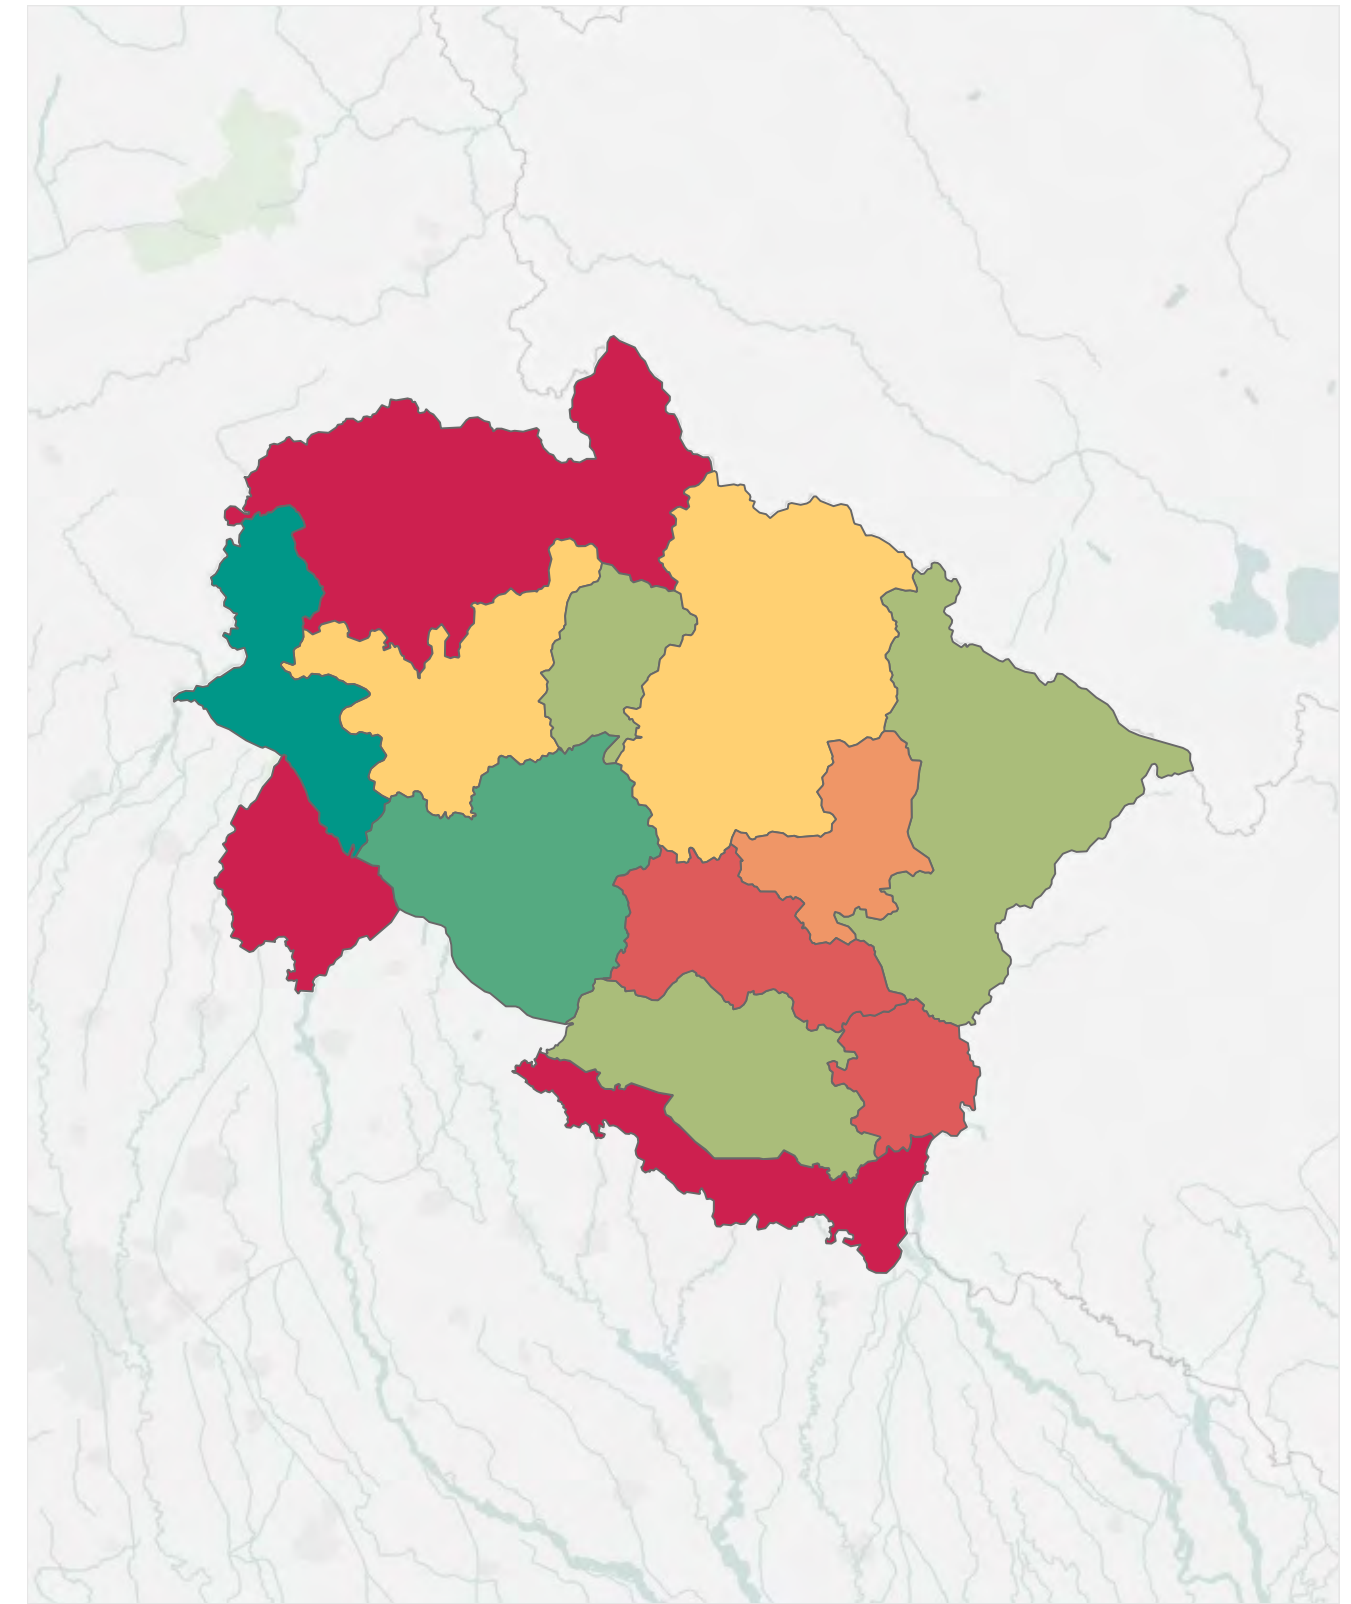

Multidimensional Poverty Index

The size of the bar represents the percentage of population who are multidimensionally poor in each district of Uttarakhand. The colour of the bar represents the MPI score of the district. The colour moves from green, through yellow, to red as the MPI score increases. Green represents areas with the lowest MPI scores while red represents areas with the highest MPI scores. The legend provides the range of MPI scores represented by a colour.

Uttarakhand

Multidimensional Poverty Index Score (District-wise)

Districts of Uttarakhand are as per the 2011 Census of India. The colour represents the MPI score of a district. The colour moves from green, through yellow, to red as the MPI score increases. Green represents areas with the lowest MPI scores while red represents areas with the highest MPI scores. The legend provides the range of MPI scores represented by a colour.

Multidimensional Poverty in Uttarakhand

Districts of Andaman & Nicobar Islands are as per the 2011 Census of India

Andaman & Nicobar Islands

Multidimensional Poverty Index Score (District-wise)

Districts of Andaman & Nicobar Islands are as per the 2011 Census of India. Due to there being a relatively lower number of districts, all Union Territories and the States of Sikkim and Goa share the same colour scale. The colour represents the MPI score of a district. The colour moves from green, through yellow, to red as the MPI score increases. Green represents areas with the lowest MPI scores while red represents areas with the highest MPI scores. The legend provides the range of MPI scores represented by a colour.

Chandigarh

A snapshot of multidimensional poverty in Chandigarh

Overview

Chandigarh Headcount Ratio, Intensity and MPI

Rural			Urban		
Headcount Ratio	Intensity	MPI	Headcount Ratio	Intensity	MPI
18.56%	47.88%	0.089	5.45%	42.76%	0.023

Chandigarh: Indicator-wise Contribution to the MPI

Percentage contribution of each indicator to the MPI score

Note on the data period: The NFHS 4 (2015-16) precedes the full roll out of flagship schemes of Pradhan Mantri Awas Yojana (PMAY), Jal Jeevan Mission (JJM), Swachh Bharat Mission (SBM), Pradhan Mantri Sahaj Bijli Har Ghar Yojana (Saubhagya), Pradhan Mantri Ujjwala Yojana (PMUY), and the Pradhan Mantri Jan Dhan Yojana (PMJDY).

Chandigarh: Uncensored Headcount Ratio

Percentage of total population who are deprived in each indicator

Note on comparison: The striped bars denote the provisional estimates of the uncensored headcount ratio based on the data available in the NFHS-5 Chandigarh UT Factsheet (2019-20).

Chandigarh: Censored Headcount Ratio

Percentage of total population who are multidimensionally poor and deprived in each indicator

Chandigarh

Multidimensional Poverty Index Score (District-wise)

Districts of Chandigarh are as per the 2011 Census of India. Due to there being a relatively lower number of districts, all Union Territories and the States of Sikkim and Goa share the same colour scale. The colour represents the MPI score of a district. The colour moves from green, through yellow, to red as the MPI score increases. Green represents areas with the lowest MPI scores while red represents areas with the highest MPI scores. The legend provides the range of MPI scores represented by a colour.

Dadra & Nagar Haveli

A snapshot of multidimensional poverty in Dadra & Nagar Haveli

Overview

Dadra & Nagar Haveli Headcount Ratio, Intensity and MPI

Rural			Urban		
Headcount Ratio	Intensity	MPI	Headcount Ratio	Intensity	MPI
44.67%	44.82%	0.2	4.89%	41.67%	0.02

Dadra & Nagar Haveli: Indicator-wise Contribution to the MPI

Percentage contribution of each indicator to the MPI score

Note on data representation: As the data period for the NFHS-4 is 2015-16, the estimates for the present Union Territory of Dadra & Nagar Haveli & Daman & Diu have been computed separately for their erstwhile regions.

Note on the data period: The NFHS 4 (2015-16) precedes the full roll out of flagship schemes of Pradhan Mantri Awas Yojana (PMAY), Jal Jeevan Mission (JJM), Swachh Bharat Mission (SBM), Pradhan Mantri Sahaj Bijli Har Ghar Yojana (Saubhagya), Pradhan Mantri Ujjwala Yojana (PMUY), and the Pradhan Mantri Jan Dhan Yojana (PMJDY).

Dadra & Nagar Haveli: Uncensored Headcount Ratio

Percentage of total population who are deprived in each indicator

Note on comparison: The striped bars denote the provisional estimates of the uncensored headcount ratio based on the data available in the NFHS-5 Dadra & Nagar Haveli District Factsheet (2019-20).

Dadra & Nagar Haveli: Censored Headcount Ratio

Percentage of total population who are multidimensionally poor and deprived in each indicator

Dimension: Health (Green), Education (Blue), Standard of Living (Pink), NFHS-5: Standard of Living (Striped Pink)

Daman & Diu

A snapshot of multidimensional poverty in Daman & Diu

Overview

Daman & Diu Headcount Ratio, Intensity and MPI

Rural			Urban		
Headcount Ratio	Intensity	MPI	Headcount Ratio	Intensity	MPI
5.19%	41.79%	0.022	7.41%	44.79%	0.033

Daman & Diu: Indicator-wise Contribution to the MPI

Percentage contribution of each indicator to the MPI score

Note on data representation: As the data period for the NFHS-4 is 2015-16, the estimates for the present Union Territory of Dadra & Nagar Haveli & Daman & Diu have been computed separately for their erstwhile regions.

Note on the data period: The NFHS 4 (2015-16) precedes the full roll out of flagship schemes of Pradhan Mantri Awas Yojana (PMAY), Jal Jeevan Mission (JJM), Swachh Bharat Mission (SBM), Pradhan Mantri Sahaj Bijli Har Ghar Yojana (Saubhagya), Pradhan Mantri Ujjwala Yojana (PMUY), and the Pradhan Mantri Jan Dhan Yojana (PMJDY).

Daman & Diu: Uncensored Headcount Ratio

Percentage of total population who are deprived in each indicator

Note on comparison: The striped and dotted bars denote the provisional estimates of the uncensored headcount ratio based on the data available in the NFHS-5 Daman District Factsheet and the NFHS-5 Diu District Factsheet (2019-20), respectively.

Daman & Diu: Censored Headcount Ratio

Percentage of total population who are multidimensionally poor and deprived in each indicator

Daman & Diu: Headcount Ratio

Percentage of population who are multidimensionally poor in each district

Multidimensional Poverty Index

The size of the bar represents the percentage of population who are multidimensionally poor in each district of Daman & Diu. The colour of the bar represents the MPI score of the district. The colour moves from green, through yellow, to red as the MPI score increases. Green represents areas with the lowest MPI scores while red represents areas with the highest MPI scores. The legend provides the range of MPI scores represented by a colour.

Multidimensional Poverty in Daman & Diu

District-wise Headcount Ratio, Intensity and MPI Score

Districts of Daman & Diu	Headcount Ratio	Intensity	MPI
Daman	7.46%	45.16%	0.034
Diu	4.34%	37.64%	0.016

Districts of Daman & Diu	Rural			Urban		
	Headcount Ratio	Intensity	MPI	Headcount Ratio	Intensity	MPI
Daman	4.95%	44.77%	0.022	8.04%	45.21%	0.036
Diu	5.51%	38.37%	0.021	2.77%	35.72%	0.010

Districts of Daman & Diu are as per the 2011 Census of India

Dadra & Nagar Haveli, & Daman & Diu

Multidimensional Poverty Index Score (District-wise)

Districts of Dadra & Nagar Haveli, & Daman & Diu are as per the 2011 Census of India. Due to there being a relatively lower number of districts, all Union Territories and the States of Sikkim and Goa share the same colour scale. The colour represents the MPI score of a district. The colour moves from green, through yellow, to red as the MPI score increases. Green represents areas with the lowest MPI scores while red represents areas with the highest MPI scores. The legend provides the range of MPI scores represented by a colour.

Delhi

A snapshot of multidimensional poverty in Delhi

Overview

Delhi Headcount Ratio, Intensity and MPI

Jammu & Kashmir, & Ladakh

A snapshot of multidimensional poverty in Jammu & Kashmir, & Ladakh

Overview

Jammu & Kashmir, & Ladakh Headcount Ratio, Intensity and MPI

Rural			Urban		
Headcount Ratio	Intensity	MPI	Headcount Ratio	Intensity	MPI
16.39%	44.27%	0.073	3.5%	42.32%	0.015

Jammu & Kashmir, & Ladakh: Indicator-wise Contribution to the MPI

Percentage contribution of each indicator to the MPI score

Note on data representation: As the data period for the NFHS-4 is 2015-16, the estimates for the present Union Territories of Jammu & Kashmir, and Ladakh have been computed for their combined geographical region.

Note on the data period: The NFHS 4 (2015-16) precedes the full roll out of flagship schemes of Pradhan Mantri Awas Yojana (PMAY), Jal Jeevan Mission (JJM), Swachh Bharat Mission (SBM), Pradhan Mantri Sahaj Bijli Har Ghar Yojana (Saubhagya), Pradhan Mantri Ujjwala Yojana (PMUY), and the Pradhan Mantri Jan Dhan Yojana (PMJDY).

Jammu & Kashmir, & Ladakh: Uncensored Headcount Ratio

Percentage of total population who are deprived in each indicator

Note on comparison: The striped and dotted bars denote the provisional estimates of the uncensored headcount ratio based on the data available in the NFHS-5 Jammu & Kashmir UT Report and the Ladakh UT Factsheet (2019-20) respectively.

Jammu & Kashmir, & Ladakh: Censored Headcount Ratio

Percentage of total population who are multidimensionally poor and deprived in each indicator

Jammu & Kashmir, & Ladakh: Headcount Ratio

Percentage of population who are multidimensionally poor in each district

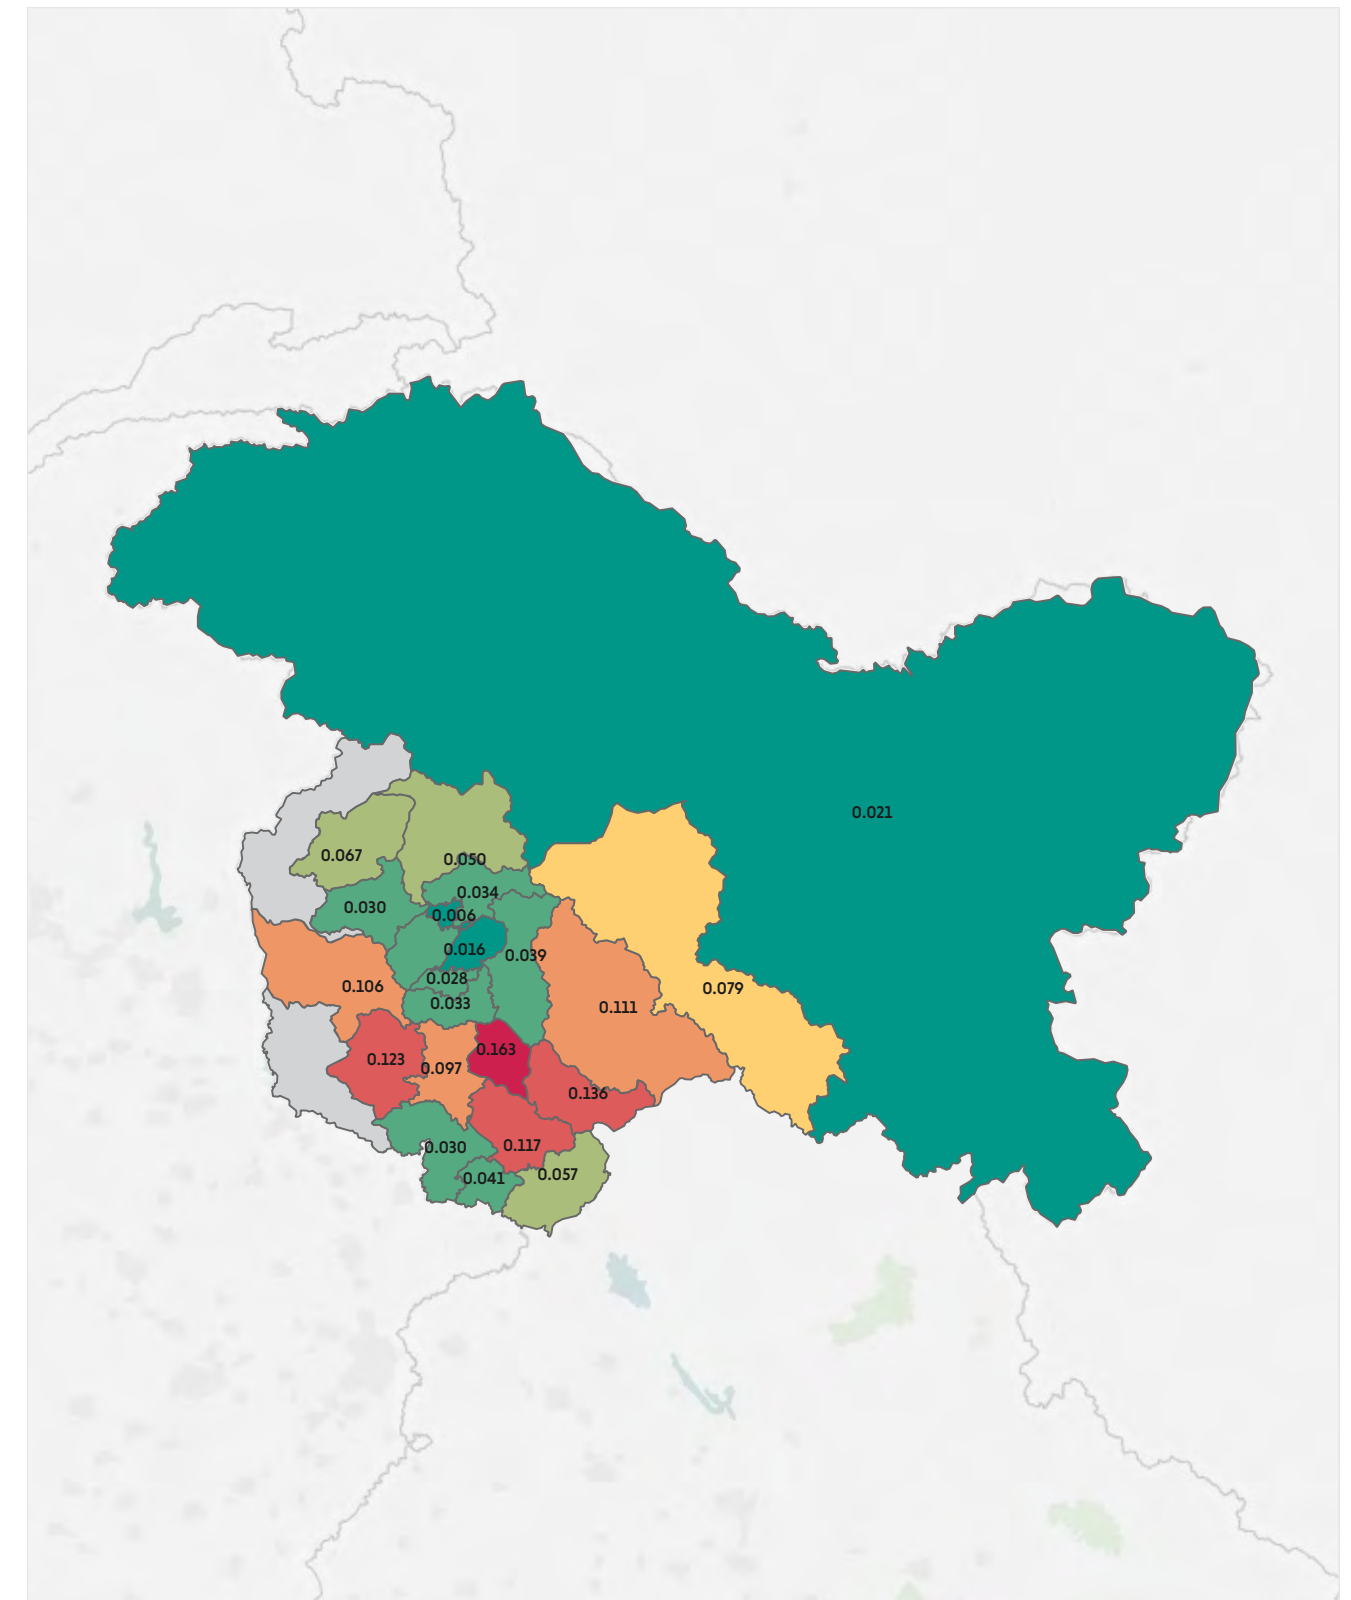

Multidimensional Poverty Index

The size of the bar represents the percentage of population who are multidimensionally poor in each district of Jammu & Kashmir, & Ladakh. The colour of the bar represents the MPI score of the district. The colour moves from green, through yellow, to red as the MPI score increases. Green represents areas with the lowest MPI scores while red represents areas with the highest MPI scores. The legend provides the range of MPI scores represented by a colour.

Jammu & Kashmir, & Ladakh

Multidimensional Poverty Index Score (District-wise)

Districts of Jammu & Kashmir, & Ladakh are as per the Political Map of India 10th Edition (Survey of India). Due to there being a relatively lower number of districts, all Union Territories and the States of Sikkim and Goa share the same colour scale. The colour represents the MPI score of a district. The colour moves from green, through yellow, to red as the MPI score increases. Green represents areas with the lowest MPI scores while red represents areas with the highest MPI scores. The legend provides the range of MPI scores represented by a colour.

TECHNICAL NOTES

ESTIMATION DETAILS

A.1 Policy for treatment of Missing Values

Any individual (and in extension household) for whom data for all indicators, and data for all constituents of an indicator is not present, is not considered in the estimation sample of the national MPI and its disaggregation. It is classified as a dropped observation.

For example, if an individual has data for eleven indicators of the national MPI but the information for one indicator is missing, that individual will not be considered in the estimation for the national MPI. Another example would be, supposing that in the indicator for drinking water, an individual has information for the type of drinking water source but information for round-trip time to the drinking water source is missing, then the individual is not considered in the estimation of the national MPI. Similarly, in the case of the indicator for sanitation, if the information for type of sanitation facility is available for an individual but the information for whether the facility is shared or exclusive is not available, then the individual is not considered for the estimation of the national MPI.

The exception to this policy is the maternal health indicator - the specific policy for which has been detailed subsequently in this section.

A.2 Policy for the indicator on Bank Accounts

If an individual, when asked if they have a bank account, has replied that they “don’t know”, they are considered to be deprived in the indicator for Bank Accounts.

In the case of the indicator for bank accounts, the NFHS-4 reports that 90.3% of individuals have stated that they have a bank account, 9.5% stated that they do not have bank account and 0.1% of individuals responded “don’t know” when asked if they have a bank account. For the national MPI, the 0.1% of individuals who responded with “don’t know” (2,969 unweighted observations) have been treated as deprived in the indicator for bank accounts. The rationale behind this is the assumption that if an individual is unaware of their ownership status for a bank account, then it may be considered analogous to them not having a bank account to begin with.

However, this assumption was not made discounting the possibility that there might be cases where the individual has chosen to not disclose the information to the survey enumerator or the person responsible for the operation of the bank account was not present in the household at the time of the survey. In such cases, the relatively low weight assigned to the bank account indicator acts as a moderator, i.e., well-off individuals who have responded “don’t know” to the bank account indicator will not be affected as they will need to be deprived in a substantial number of other indicators to be considered as multidimensionally poor and on the other hand individuals who are already multidimensionally poor by virtue of other indicators will be retained in the final estimation sample.

A.3 Policy for the indicator on Maternal Health

The indicator for maternal health is a composite of 2 discrete datapoints - the number of antenatal care visits a woman received during her last pregnancy and the type of assistance (if any) that she received during the birth of her last child. In order for her to be considered as deprived in the indicator for maternal health, she has to have a) received less than 4 antenatal care visits (deprived in antenatal care) or b) not received assistance from a skilled healthcare provider during childbirth (deprived in assisted delivery). In order to be deprived in the indicator for maternal health, a woman must be deprived in either antenatal care or assisted delivery.

If the information for both antenatal care and assisted delivery are missing, then, adhering to the policy for treatment of missing values, the woman for whom the information is missing, is not included in the estimation of the national MPI.

The conundrum however arises, when the information for either antenatal care (or assisted delivery) is present, but the information for assisted delivery (or antenatal care) is missing. Therefore, there are 9 possible scenarios which may occur during the determination of the maternal health indicator.

Outcome Number	Deprived in Antenatal Care	Deprived in Assisted Delivery	Deprivation Status in Maternal Health
1	No	No	No
2	Yes	No	Yes
3	No	Yes	Yes
4	Yes	Yes	Yes
5	Yes	Information Missing	Yes
6	Information Missing	Yes	Yes
7	No	Information Missing	?
8	Information Missing	No	?
9	Information Missing	Information Missing	Obs. is dropped from estimation sample

The decision regarding the deprivation status of the maternal health indicator is fairly straightforward for outcomes 1 through 6 and outcome number 9. The problem lies with outcomes 7 and 8, where a woman is not deprived in Antenatal Care but the information for Assisted Delivery is missing and vice versa. This is because the indicator for which the information is missing may take a value of deprived or not deprived thereby determining the status of the maternal health indicator as a whole. Thus, for observations falling in outcomes 7 and 8, it becomes impossible to determine the actual deprivation status of the maternal health. A total number of 6,087 unweighted observations fall in outcome 8 and there are no observations in outcome 7.

If the policy for treatment of missing values is to be applied, then these 6,087 indicators would be dropped from the final estimation sample. This however would risk further reducing an already restricted sample (women who have had at least one childbirth in the 5 years preceding the survey) of observations eligible for the maternal health indicator.

Therefore, an exception to the policy for treatment of missing indicators has been made for the maternal health indicator in order to retain the 6,087 observations in the final MPI estimation sample. In its place a different policy has been utilized, the policy is as follows:

For individuals where the information for either antenatal care or assisted delivery is missing while the information for the other is present and takes a value of "not deprived", the individual is included in the estimation sample of the national MPI only if their deprivation score is higher than the second order cutoff and irrespective of the value taken by the indicator on maternal health.

A.3.1 There are four steps involved to implement this policy, they have been outlined in the following paragraphs.

4.4.2.i Step 1

Identify the number of observations for which either antenatal care or assisted delivery is not deprived while the information for the other is missing. There are 6,087 observations which are not deprived in assisted delivery and whose information for antenatal care is missing. There are no observations which are not deprived in antenatal care and for whom the information on assisted delivery is missing.

4.4.2.ii Step 2

Within the 6,087 observations determine the ones where the deprivation score is above the second order cut-off (i.e. $c_i > k$) for 2 specific scenarios:

Scenario 1: Assume 6,087 observations are not deprived in maternal health and compute the deprivation scores for them. Identify the observations for whom the deprivation score is above 33.33%. Scenario 1 yields the following results,

MPI Poor	Freq.	Percent
No	4,908	80.63
Yes	1,071	17.59
Missing	108	1.77
Total	6,087	100.00

4,908 observations are not multidimensionally poor, 1,071 are multidimensionally poor and 108 have missing values in other indicators and have been dropped from the sample.

Scenario 2: Assume 6,087 observations are deprived in maternal health and compute the deprivation scores for them. Identify the observations for whom the deprivation score is above 33.33%. Scenario 2 yields the following results,

MPI Poor	Freq.	Percent
No	3,767	61.89
Yes	2,212	36.34
Missing	108	1.77
Total	6,087	100.00

3,767 observations are not multidimensionally poor, 2,212 are multidimensionally poor and 108 have missing values in other indicators and have been dropped from the sample.

4.4.2.iii Step 3

Identify observations whose deprivation status remain unchanged across both scenario's 1 and 2. That is, we identify the observations for whom the deprivation score remains above or below 33.33% irrespective of the value taken by the maternal health indicator.

4,838 (3,767 not deprived and 1,071 deprived) observations remain common across both the scenarios i.e. their deprivation status ($c_i \geq k$ or $c_i < k$) remains unchanged irrespective of the value taken by the maternal health indicator.

4.4.2.iv Step 4

Of the 6,087 identified ambiguous observations, it can be determined with absolute certainty that 4,838 observations will remain multidimensionally poor or not regardless of the value taken by the maternal health indicator.

Therefore, these 4,838 observations will be retained in the estimation sample of the national MPI.

A.4 Sample size

The national MPI utilizes 2,699,110 unweighted observations from the NFHS 4 as its estimation sample. This sample size consists of de jure household members for whom the data for all twelve indicators of the national MPI is present. Therefore, from the 2,869,043 unweighted observations present in the NFHS-4 microdata, 67,085 (2.34%) observations belonging to non-usual household members have been dropped. A further 102,848 observations (3.58%) were dropped due to them missing the data for one or more component indicators of the national MPI.

The national MPI thus uses 94.08% of the total unweighted sample of the NFHS-4 for estimation. In comparison, the global MPI uses 94.2% of the total unweighted sample of the NFHS-4 for estimation.

A.5 Micro-data Extraction, Treatment, and Visualization

The micro-data for the NFHS 4 was obtained from the official repository of the Demographic and Health Surveys Program. The estimation of India's national MPI, its indicators, and related estimates was done utilizing the Birth Recode (IABR74FL), Individual Recode (IAIR74FL), Men's Recode (IAMR74FL), and Person's Recode (IAPR74FL).

Extraction of data, adjustments for survey design and application of sample weights was completed adhering to the procedures stated in the Standard Recode Manual for DHS-6. As the reporting of data was done up to the level of urban and rural areas within a district, the occurrence of singleton sampling units within a strata was inevitable, particularly in designated rural areas of primarily urban districts. For such occurrences, the standard errors have not been reported and has been replaced with "***".

The processing of the data and computation of point estimates and estimate variance was carried out in STATA 16 (MP) and STATA 17 (MP). The final point estimates and standard errors were exported to Microsoft Excel for visualization. The choropleth maps were constructed in Tableau and QGIS using Shapefiles obtained from Survey of India.
